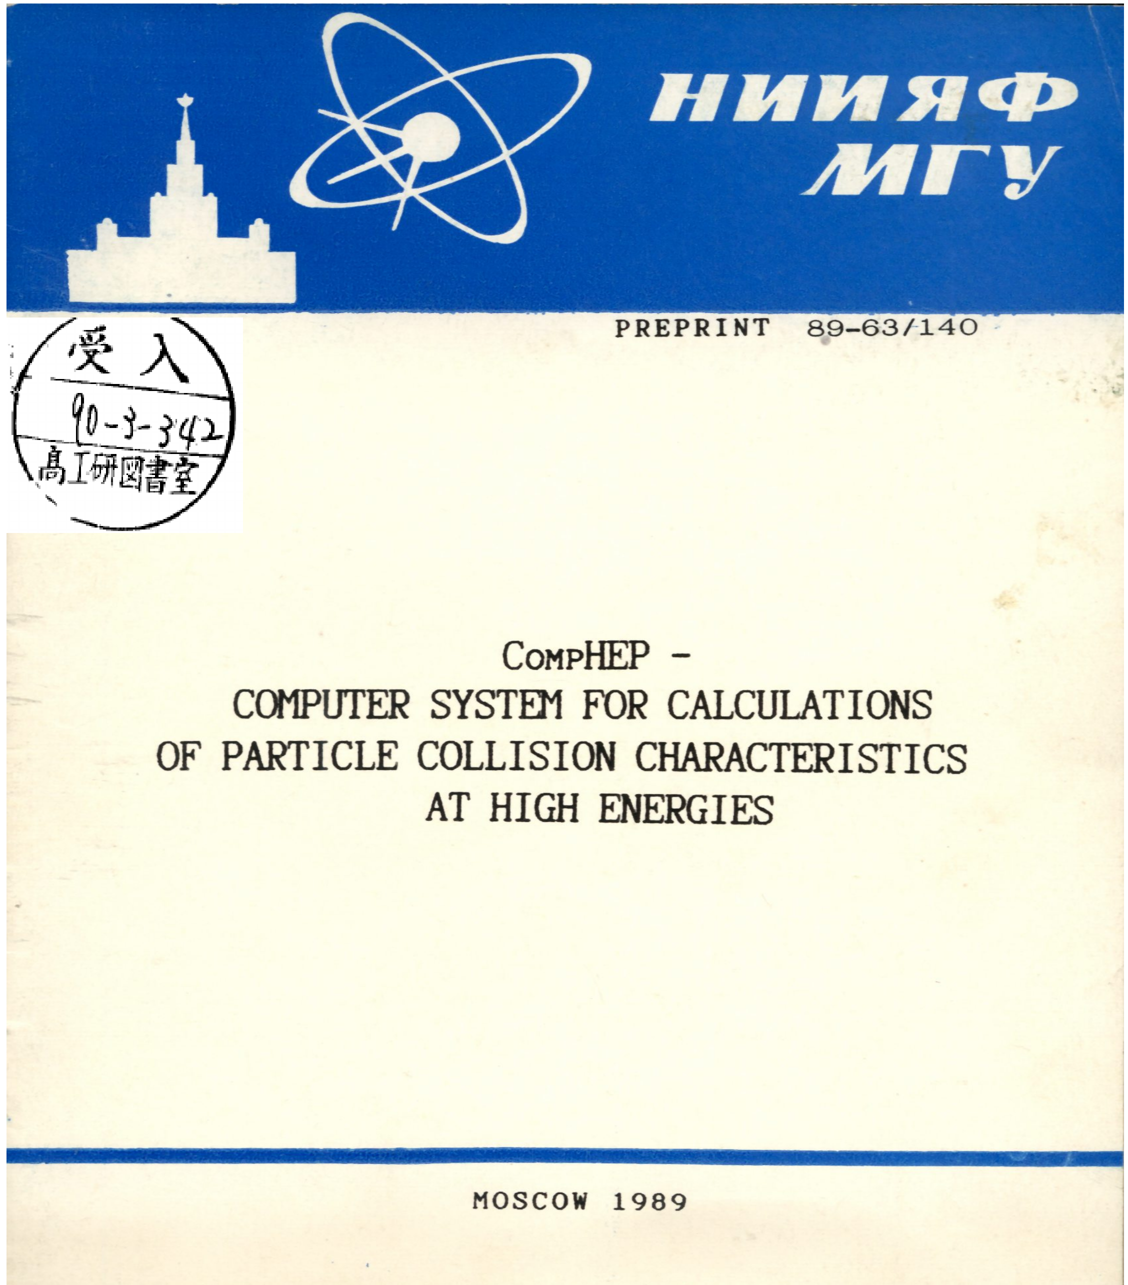
http://comphep.sinp.msu.ru

Outline

- **History and statistics**
- **Tools for BSM physics: combined global fits, operations with tables, subsidiary bosons**
- **Miscellaneous: batch modes, ROOT output, LHA formats, MCDB, nuclear PDF's,...**

27 years of CompHEP project in 2016

Primary publication: 1989



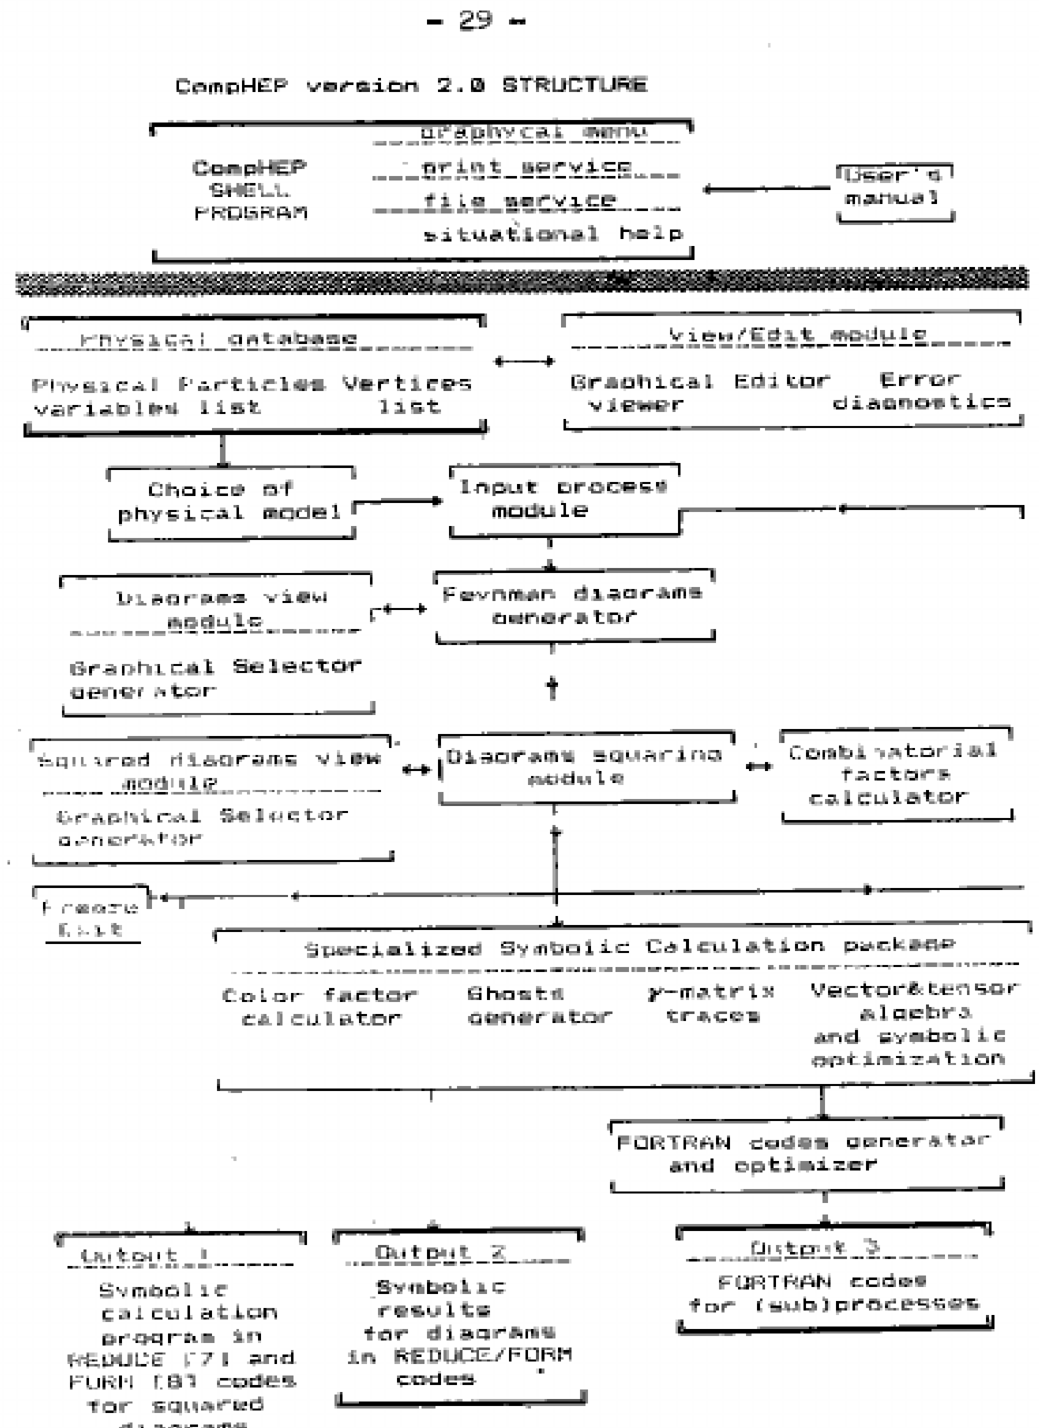
НИИЯФ
МГУ

PREPRINT 89-63/140

CompHEP -
COMPUTER SYSTEM FOR CALCULATIONS
OF PARTICLE COLLISION CHARACTERISTICS
AT HIGH ENERGIES

MOSCOW 1989

CompHEP general structure, SINP MSU preprint 91-9/213, 1991



Last stable version CompHEP 4.5.2 ,
download possible from http://comphep.sinp.msu.ru

Main objectives

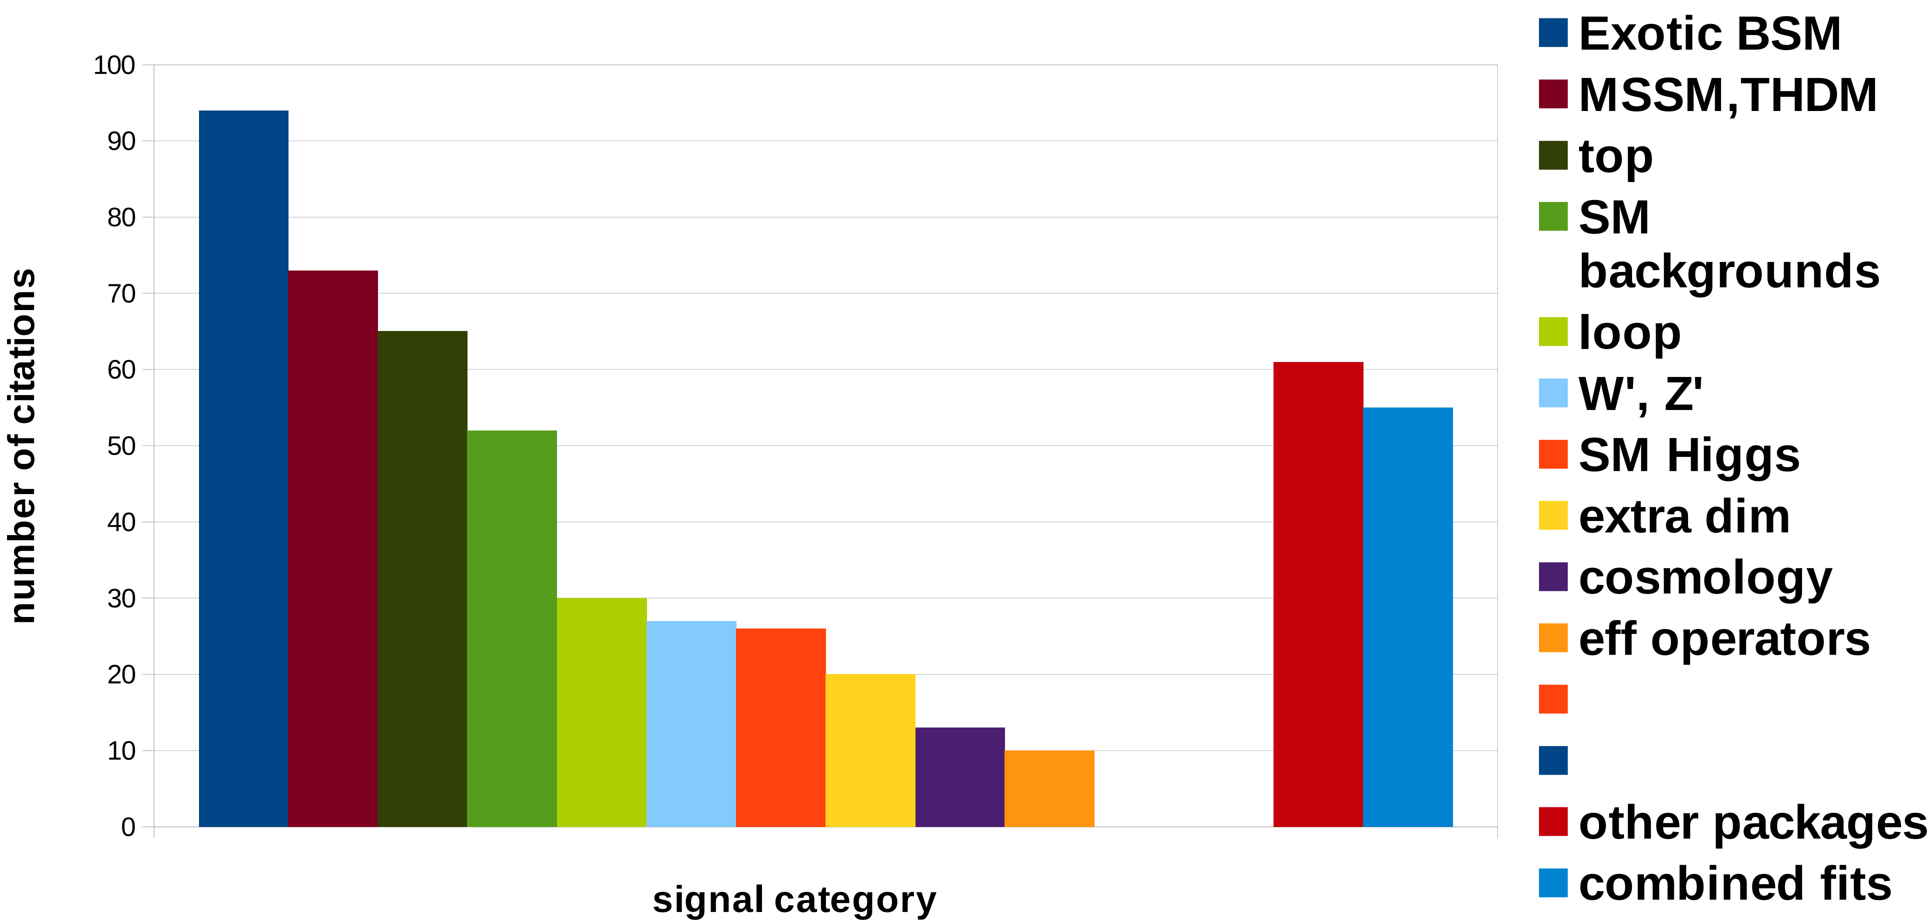
- **Automation of tree level diagram calculations**
- **“Unification” of symbolic and numerical calculation, unweighted event generation for detector simulation – a full computational chain for collider physics**
- **Interfacing to other generators (partonic showering, hadronization, masses and mixings)**
- **Interfacing to NLO codes: cross section calculators, mass spectrum calculators**

Features

- **Generation of complete gauge invariant sets of tree-level Feynman diagrams**
- **Symbolic calculation of squared diagrams**
- **Generation of binary for numerical integration by Monte-Carlo method and calculation of cross sections and distributions**
- **Unweighted events generation**
- **Convenient format of built-in models. CompHEP can work with 0,1/2,1-spin particles, Majorana and Dirac spinors, 3- and 4-vertices with fields, derivatives of fields, functions of model parameters**
- **User-friendly interface: GUI for both symbolic and numerical parts, comprehensive built-in help (F1), batch scripts**
- **Generation of models by means of LanHEP (see http://theory.sinp.msu.ru/~semenov/lanhep.html)**

Distribution of citations: theory

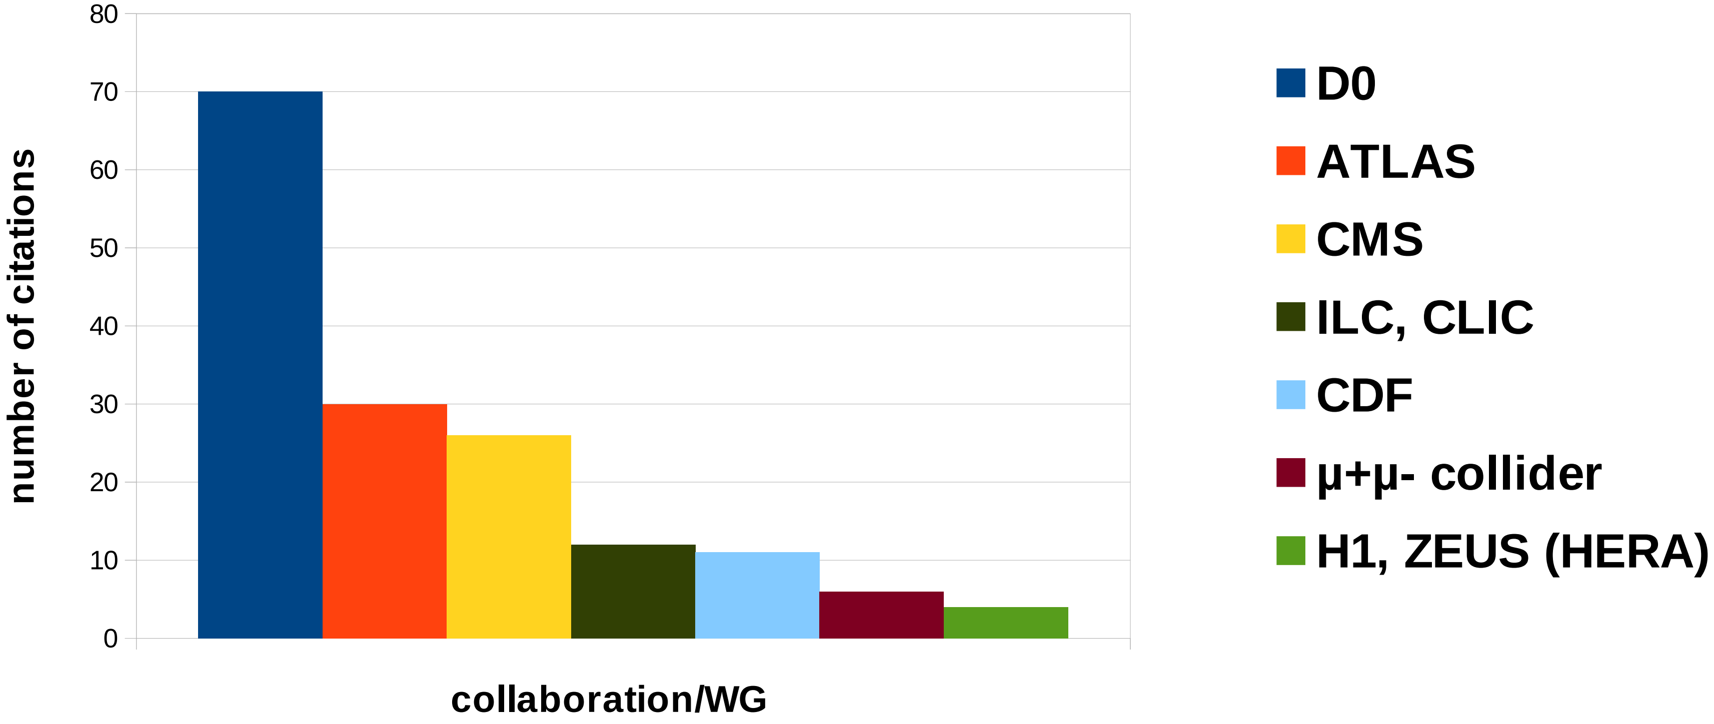
CompHEP, NIM, A534 (2004) 250, 560 citations (period 2005 - june 2016)



Exotic BSM ⇒ scalar and vector leptoquarks, leptons and quarks of 4th generation, dileptons,mirror fermions,invisible H,little H, strong EW SB, color in the SB sector...

Distribution of citations: experimental analyses and simulations

CompHEP, NIM, A534 (2004) 250, 560 citations (period 2005 - june 2016)



General approach of CompHEP, GRACE, 1990, has been reproduced after 2000 and extended:

Automatic event generation by ATLAS,CMS, etc.

(1) Sherpa + OpenLoops, FeynRules interface

(2) Madgraph5 + Pythia6, MC@NLO, MEPS@NLO, Mi@NLO, MadLoop, FeynRules interface

(3) Omega/Whizard, LO and NLO

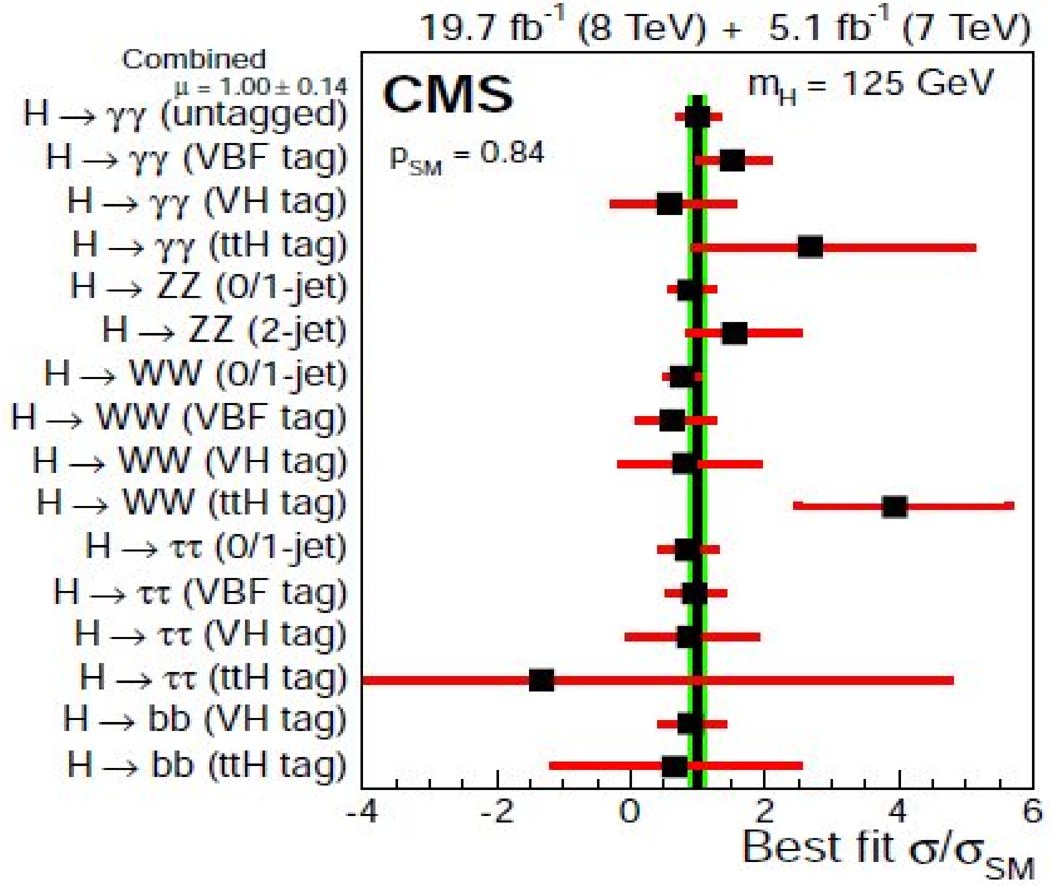
Automatic check of models and hypotheses:

Checkmate, Delphes, Gambit

[more details E.Boos,M.D. Phys.Usp. 53 (2010) 1039]

Global fits

The signal strength and the signal strength error for various groups of Higgs boson production channels



Overall signal strength – all channels

$$1.00^{+0.14}_{-0.13}\ \left[\pm 0.09(\mathrm{stat.})^{+0.08}_{-0.07}(\mathrm{theo.}) \pm 0.07(\mathrm{syst.})\right]$$

Signal strength and exclusion contours in the SME (Standard Model Extension) parameter space

$$(1) \quad \mu_i = \frac{\left[\sum_{j=1}^{N_{ch}} \sigma_{j\to H} \, Br(H \to i)\right]_{SME}}{\left[\sum_{j=1}^{N_{ch}} \sigma_{j\to H} \, Br(H \to i)\right]_{SM}} \qquad (2) \quad \mu_i = \frac{\left[\sum_{j=1}^{N_{ch}} \sigma_{j\to H(off-shell)\to i}\right]_{SME}}{\left[\sum_{j=1}^{N_{ch}} \sigma_{j\to H(off-shell)\to i}\right]_{SM}}$$

(1) signal strength in the production × decay approximation
(narrow width approximation or infinitely small width approximation);
(2) signal strength for complete gauge invariant set

$$\hat{\mu}_i = \frac{N_{obs,i} - N_{backgr,i}}{N^{SM}_{signal,i}}$$

- best fit of the signal strength for the number of experimentally observed signal events N_{OBS}, the number of background events N_{BACKGR} and the number of Standard Model events N^{SM}_{SIGNAL};

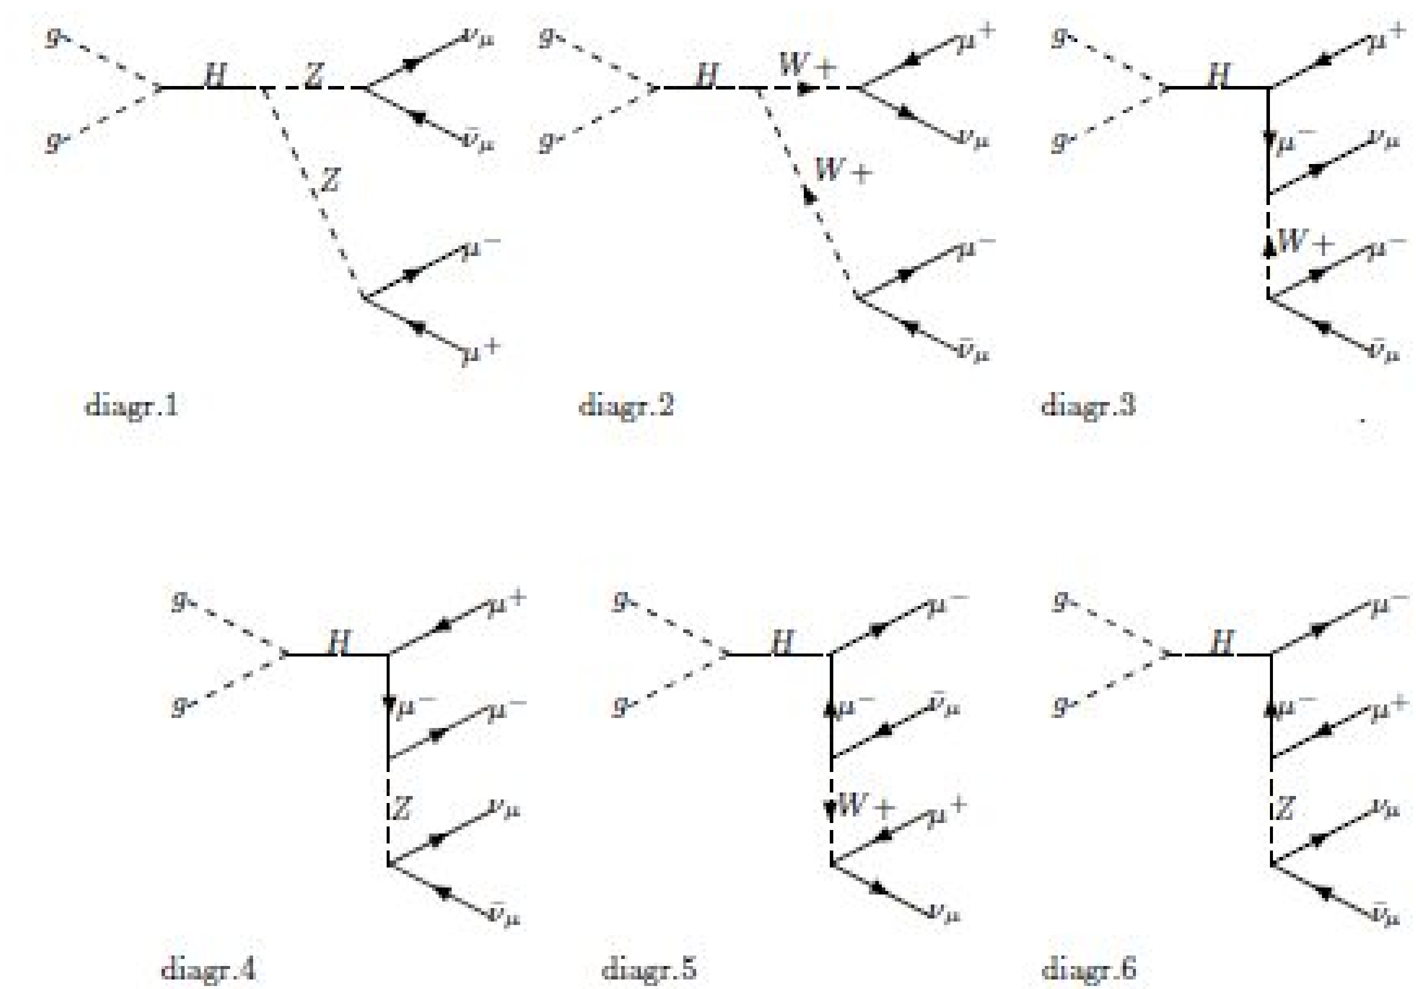
$$\chi^2_{N_{ch}} = \sum_{i=1}^{N_{ch}} \frac{(\mu_i - \hat{\mu}_i)^2}{\sigma_i^2}$$

MC **- $\chi^2_{N\_ch}$ distribution for the number of production channels N_{CH};**

Beyond the infinitely small width approximation

In a number of channels the interference terms are not small (especially for γγ, WW and ZZ exchange diagrams). Individual contributions of t-channel and subleading s-channel diagrams are usually small, but the number of such diagrams can be of the order of 100 (especially μμμμ)

Example: $gg \rightarrow (W^*W^*, Z^*Z^*) \rightarrow \nu_\mu \nu_\mu \mu^+ \mu^-$



- Up to which degree the SM Higgs boson is consistent with the available data? More than 200 production ⊗ decay combinations and rearrangements are measured
- Structrure of the couplings can be extracted correlating event rates from all channels
- Deviations from the SM are introduced in the form of effective operators O. Anomalous couplings C parametrize the deviations

$$L^{(6)}_{eff} = \frac{1}{\Lambda^2} \sum_{k=V,F} C_{k\Phi} O_{k\Phi}$$

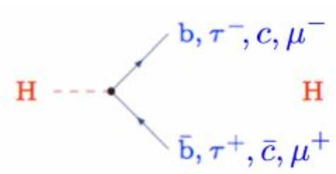
- Global fit in the anomalous coupling space is performed combining all production channels

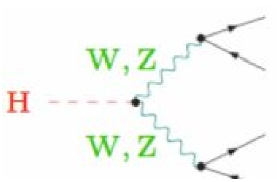
E.Boos, V.Bunichev, M.D.,Y.Kurihara Phys.Rev.D 2014, Phys.Lett.B 2014

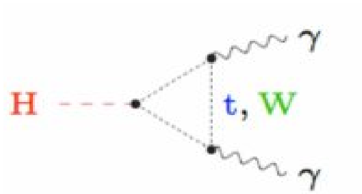
Uses signal strength definition (2) — complete gauge invariant sets

(c_V,c_F) parametrization.

c_V rescales the VVH, c_F rescales the FFH







$$c_F = 1 + C_{t\Phi} \cdot \frac{v^2}{\Lambda^2}$$

$$c_V = 1 + \frac{v^2}{2\Lambda^2} \cdot C_{\Phi}^{(1)}$$

$$c_G = c_F + \frac{6\pi}{\alpha_s} \cdot C_{\Phi G} \cdot \frac{v^2}{\Lambda^2}$$

$$c_\gamma = \frac{63 c_F - 16 c_V}{47} + \frac{9\pi}{4\alpha} \cdot (c_w^2 \cdot C_{\Phi B} + s_w^2 \cdot C_{\Phi W}) \cdot \frac{v^2}{\Lambda^2}$$

$$c_Z = (s_w^2 \cdot C_{\Phi B} + c_w^2 \cdot C_{\Phi W}) \cdot \frac{v^2}{\Lambda^2}$$

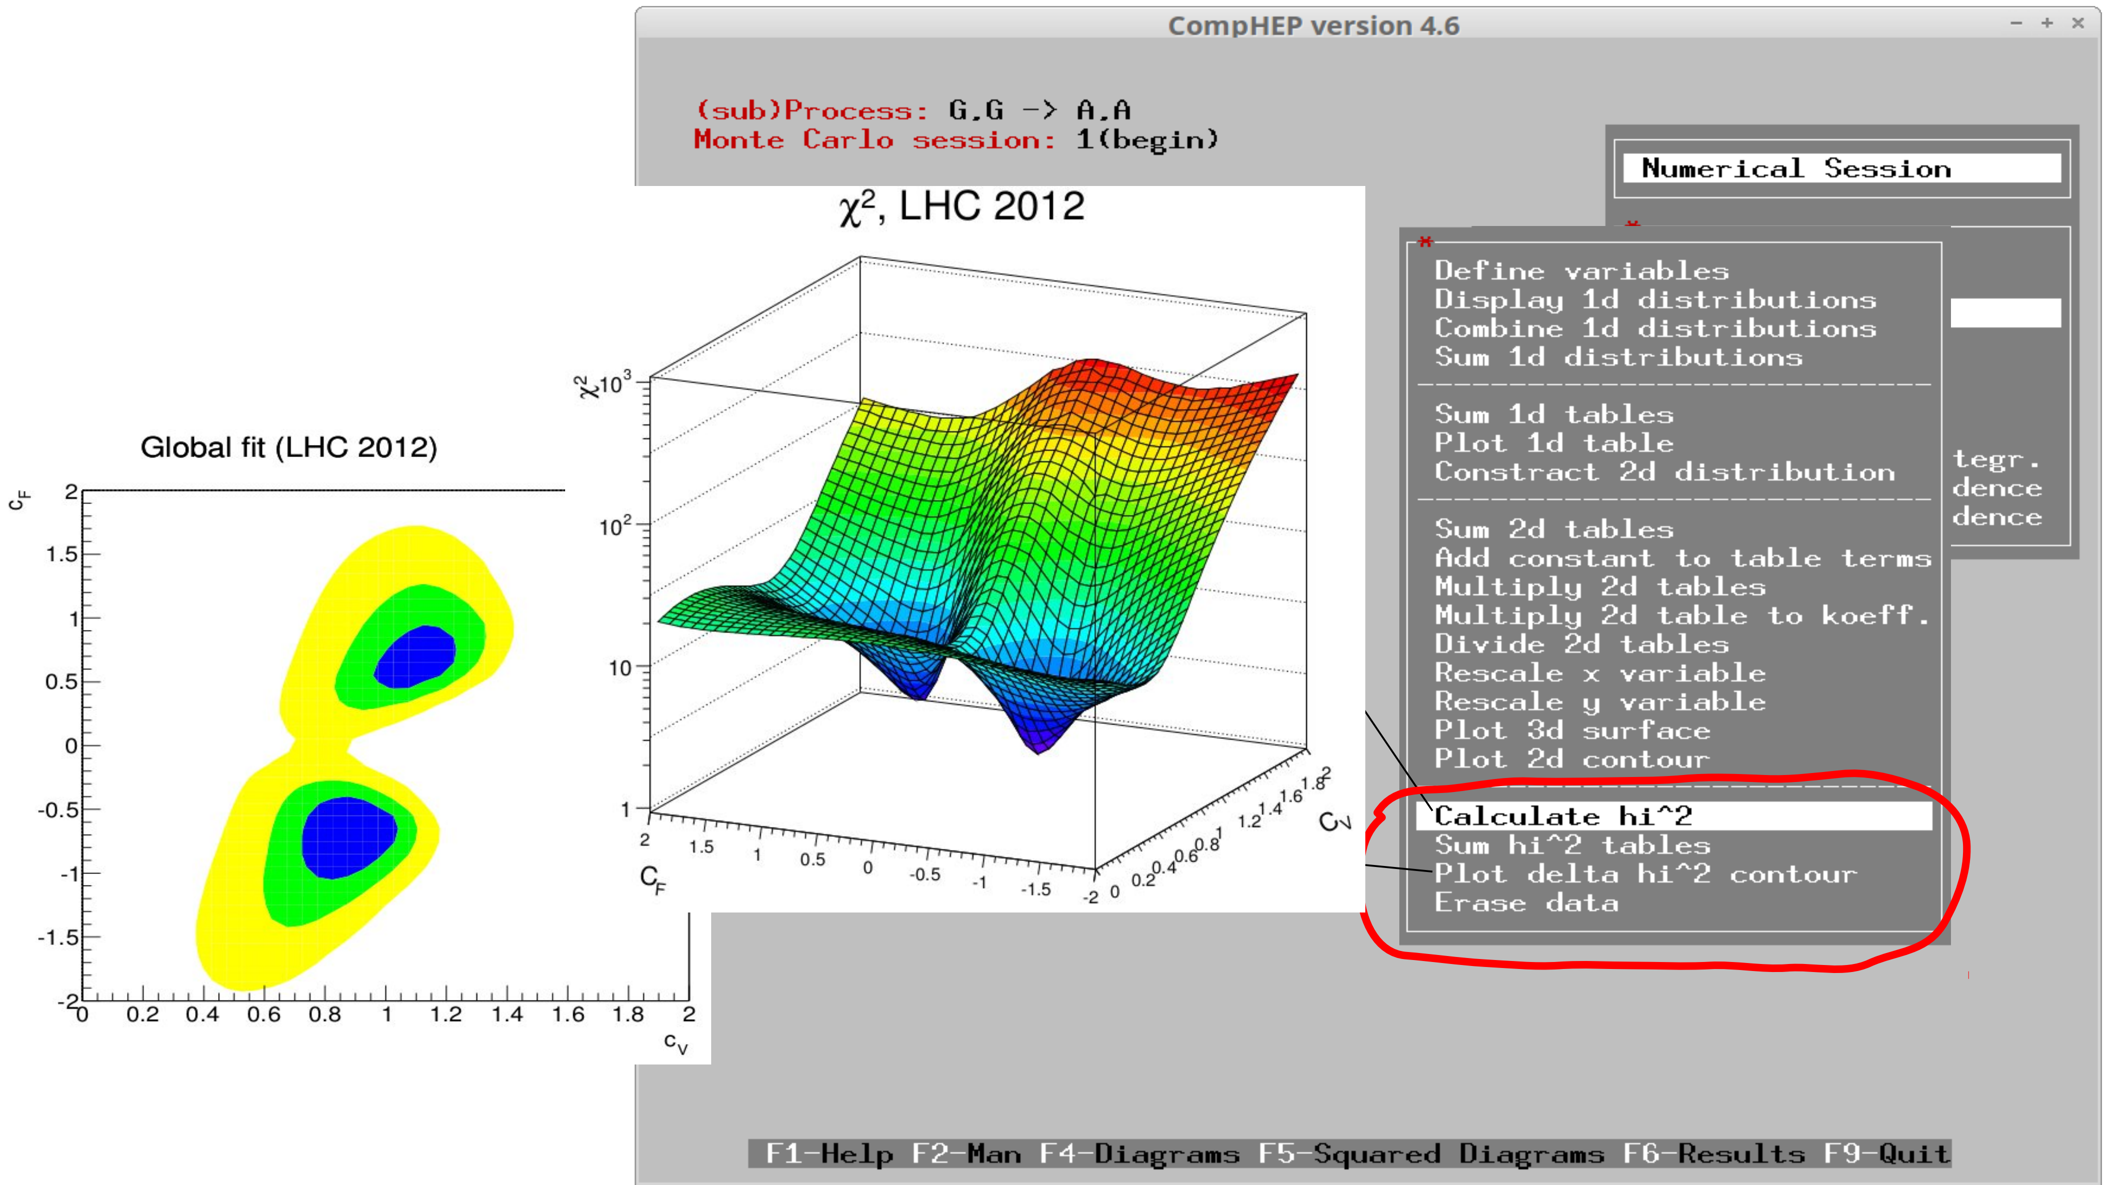
$$c_W = C_{\Phi W} \cdot \frac{v^2}{\Lambda^2}$$

the SM limit [cF=1, cV=c_G=c_γ=1, c_W=0,c_Z=0]
with the one-loop induced H→gg, H→γγ is clearly seen.

Effective triple vertices with the (c_F , c_V) parametrization

Triple vertices	Feynman rules
$\bar{t} \quad t \quad H$	$-\frac{M_t}{v} \cdot c_F$
$\bar{b} \quad b \quad H$	$-\frac{M_b}{v} \cdot c_F$
$\bar{\tau} \quad \tau \quad H$	$-\frac{M_\tau}{v} \cdot c_F$
$G_\mu \quad G_\nu \quad H$	$-\frac{2}{v} \cdot \frac{\alpha_s}{6\pi} \cdot c_G \cdot (g^{\mu\nu} p_1 p_2 - p_1^\nu p_2^\mu)$
$A_\mu \quad A_\nu \quad H$	$-\frac{2}{v} \cdot \frac{4\alpha}{9\pi} \cdot c_\gamma \cdot (g^{\mu\nu} p_1 p_2 - p_1^\nu p_2^\mu)$
$A_\mu \quad Z_\nu \quad H$	$+2 \cdot c_w \cdot s_w \cdot (C_{\Phi B} - C_{\Phi W}) \cdot \frac{v}{\Lambda^2}(g^{\mu\nu} p_1 p_2 - p_1^\nu p_2^\mu)$
$Z_\mu \quad Z_\nu \quad H$	$+\frac{2}{v} \cdot [M_Z^2 \cdot c_V \cdot g^{\mu\nu} - c_Z \cdot (g^{\mu\nu} p_1 p_2 - p_1^\nu p_2^\mu)]$
$W_\mu^+ \quad W_\nu^- \quad H$	$+\frac{2}{v} \cdot [M_W^2 \cdot c_V \cdot g^{\mu\nu} - c_W \cdot (g^{\mu\nu} p_1 p_2 - p_1^\nu p_2^\mu)]$

Basic object: χ^2 measure in the anomalous coupling space. Global fits to μ in (cF,cV) plane are performed. Dispersion matrix of the observables convoluted with vector differences between the observed and calculated μ values defines χ^2. The minimum of χ^2 is found and 65%,90% and 99% best fit CL regions in the (cF,cV) space are defined by deviations from χ^2_min less than 2.1,4.6 and 9.2, respectively.



New features of CompHEP v. 4.6
useful for generation of global fits

Implementation of external functions in the Constraints Model Table

Multiplication of selected squared diagrams on an external function

Table calculations and algebraic operations with tables — cross section/width vs parameters

ROOT code generation to draw table functions (3D surfaces or 2D contours)

Generation of 3-DIM phase space distributions dependent on a model parameter

CompHEP Standard Model

myfunc.c

```c
double myfunc3 (double ym, double keyp)
{
  double result, Fym, as, sqr, logs;

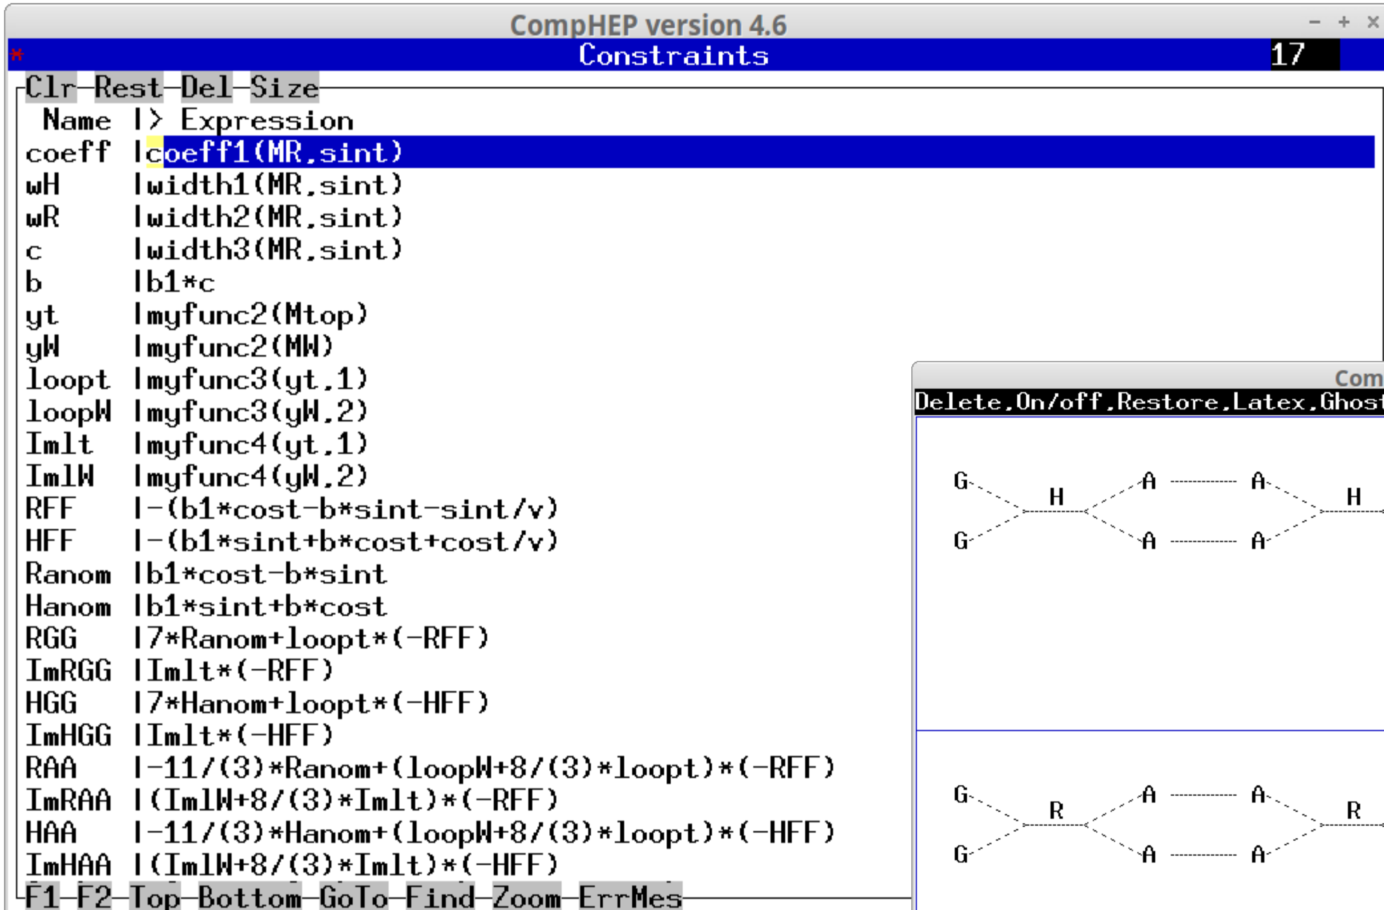
  as = asin(1./sqrt(fabs(ym)));
  sqr = sqrt(fabs(1.-ym));
  logs = log((1.+sqr)/(1.-sqr));

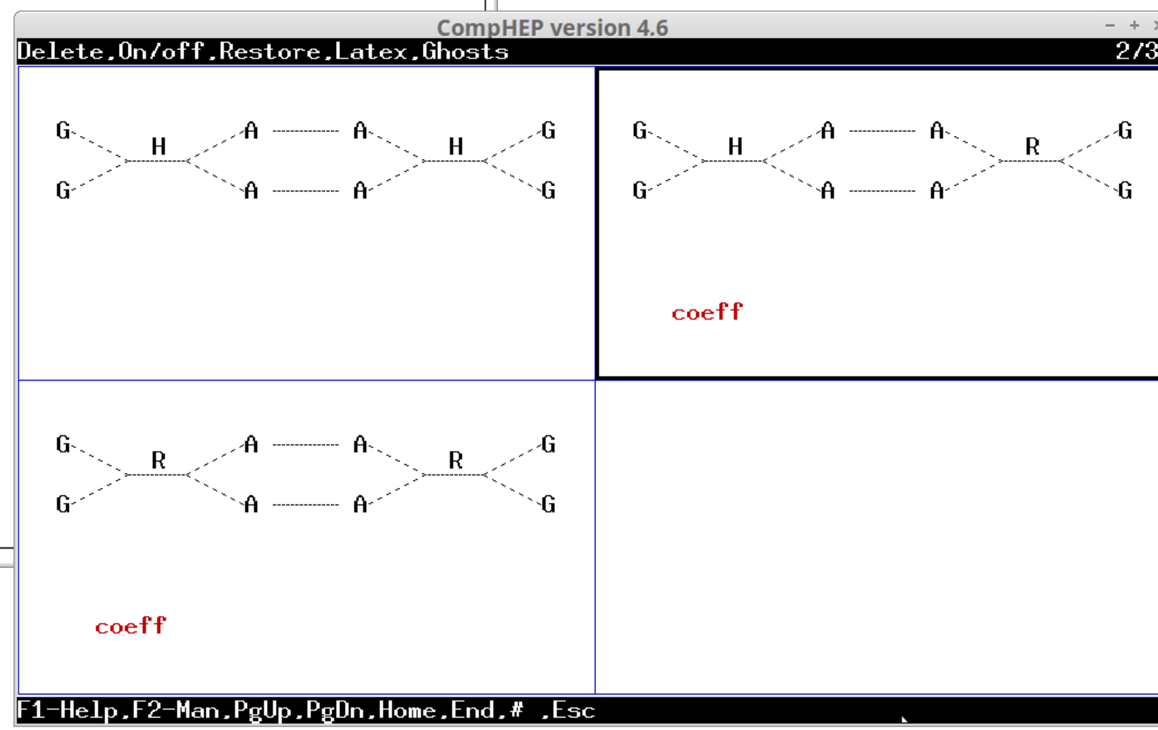
  if(ym >= 1.0) Fym = as*as;
  else          Fym = -0.25*(logs*logs-9.869587728);

  if(keyp < 1.5)   result = ym*(1.+(1.-ym)*Fym);
  else             result = -(2. + 3.*ym + 3.*ym*(2.-ym)*Fym);

  return result;
}
```

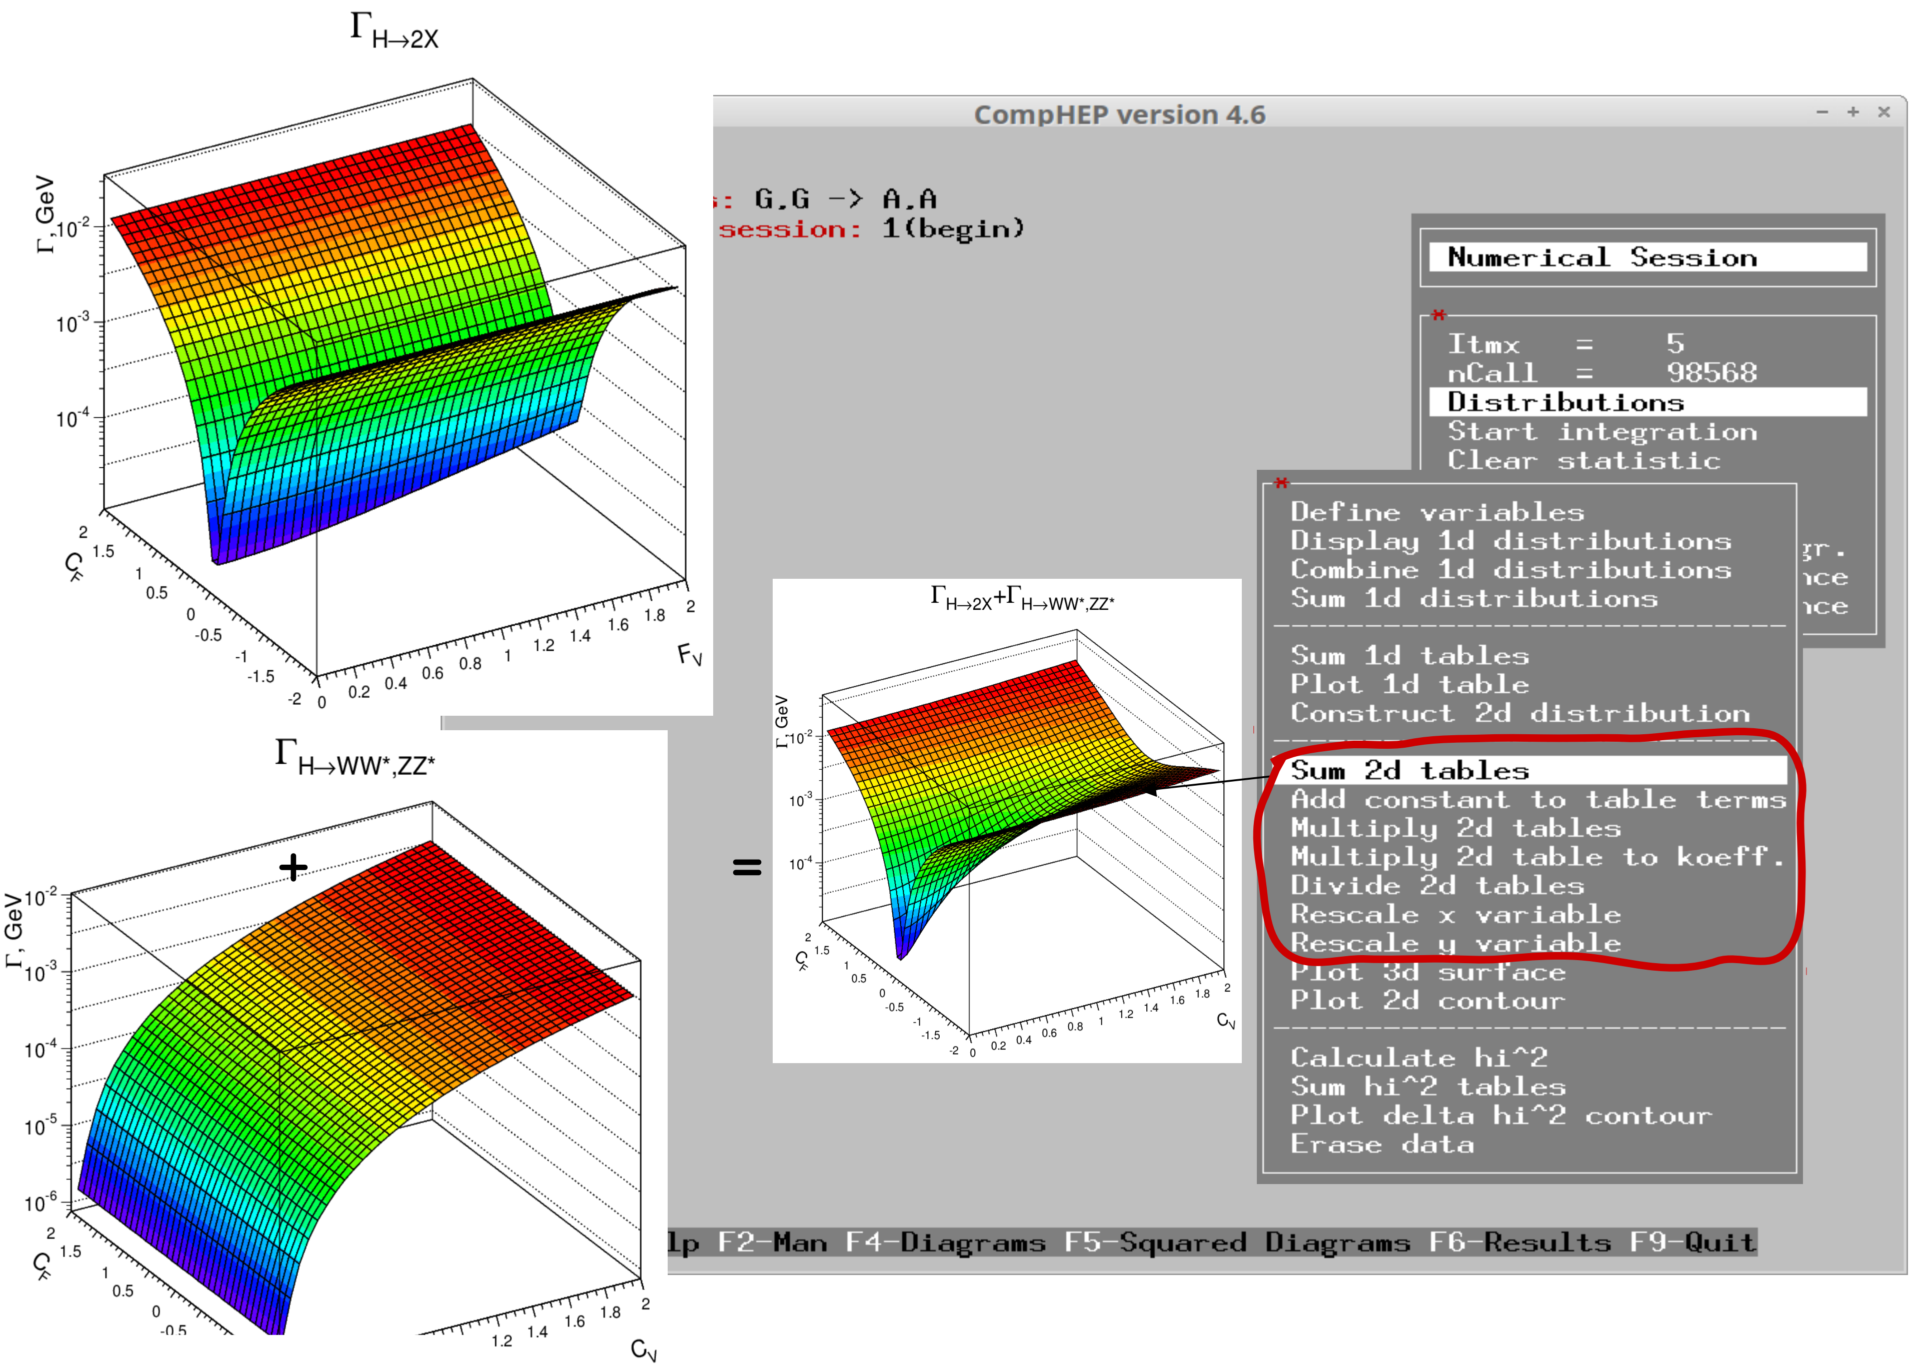
Multiplication of selected squared diagrams on an external function



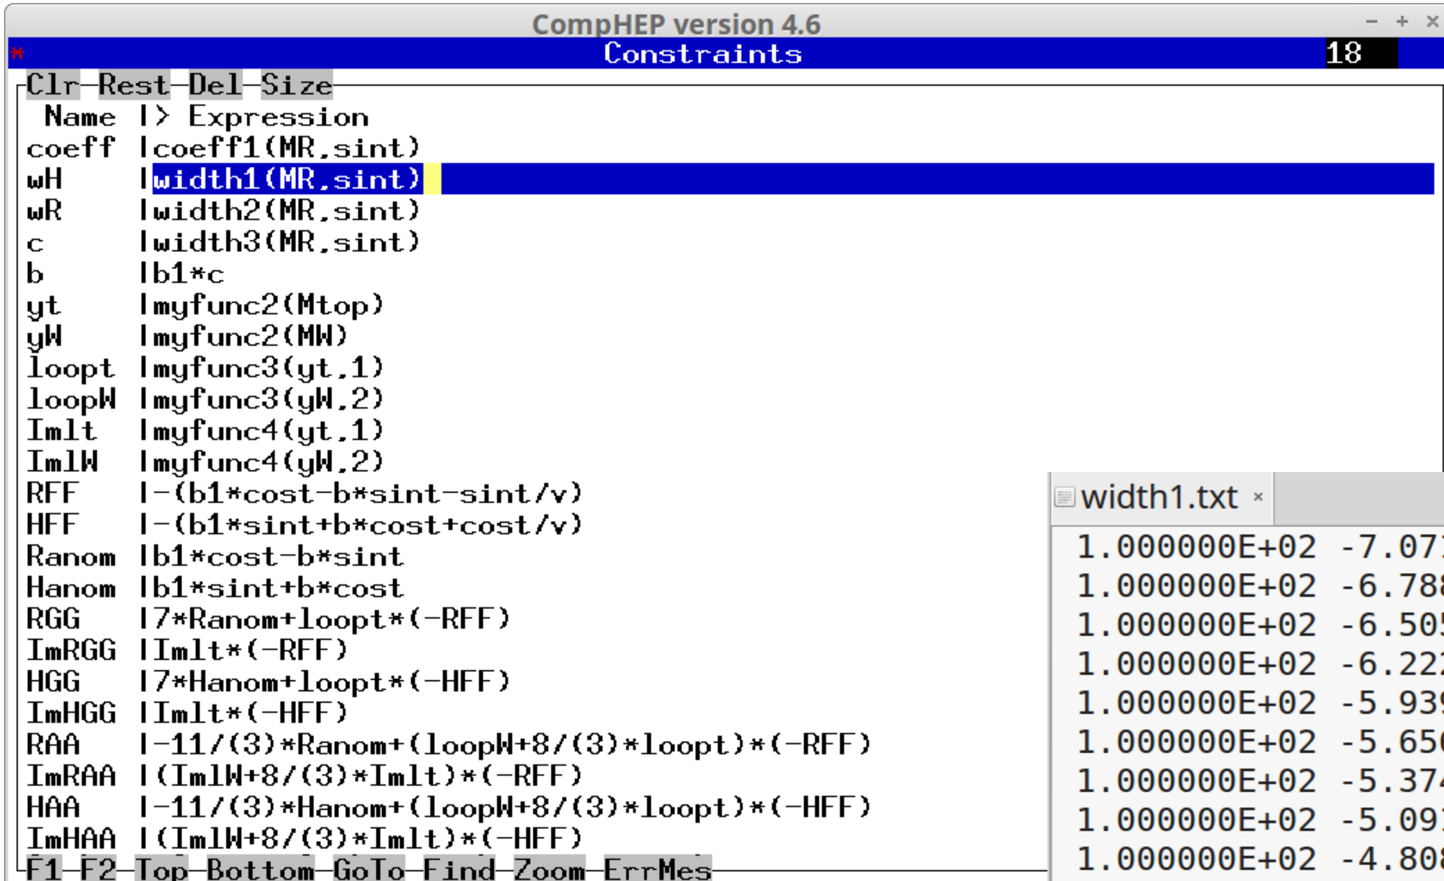


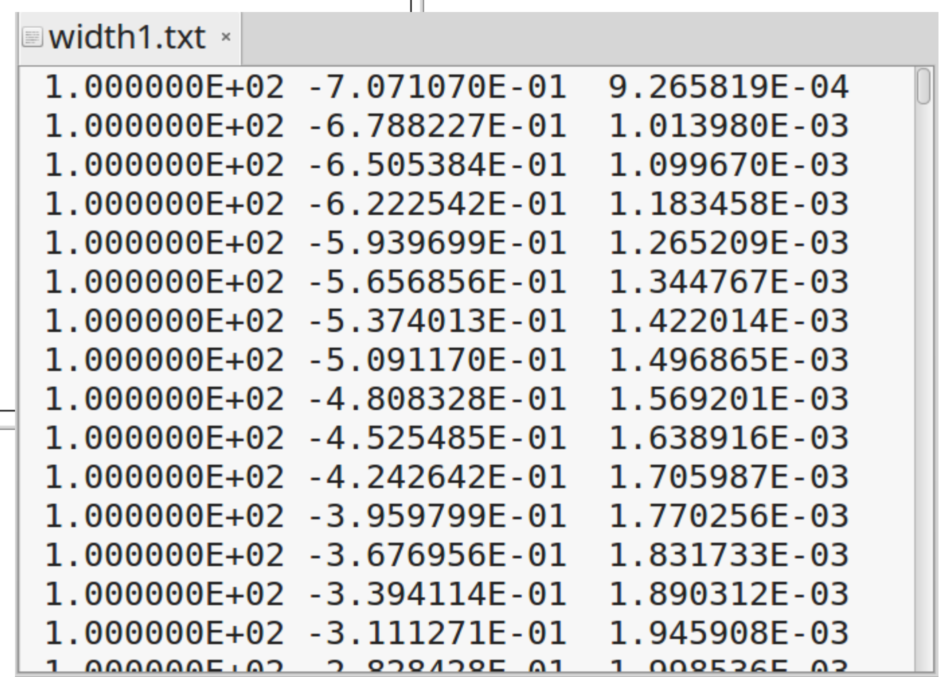
One can mark some squared diagrams in GUI mode,
these diagrams are then multiplied by the function «coeff»,
where «coeff» is an external "c" -function or two-dimensional table

Algebraic operations with tables —cross section/width vs parameters

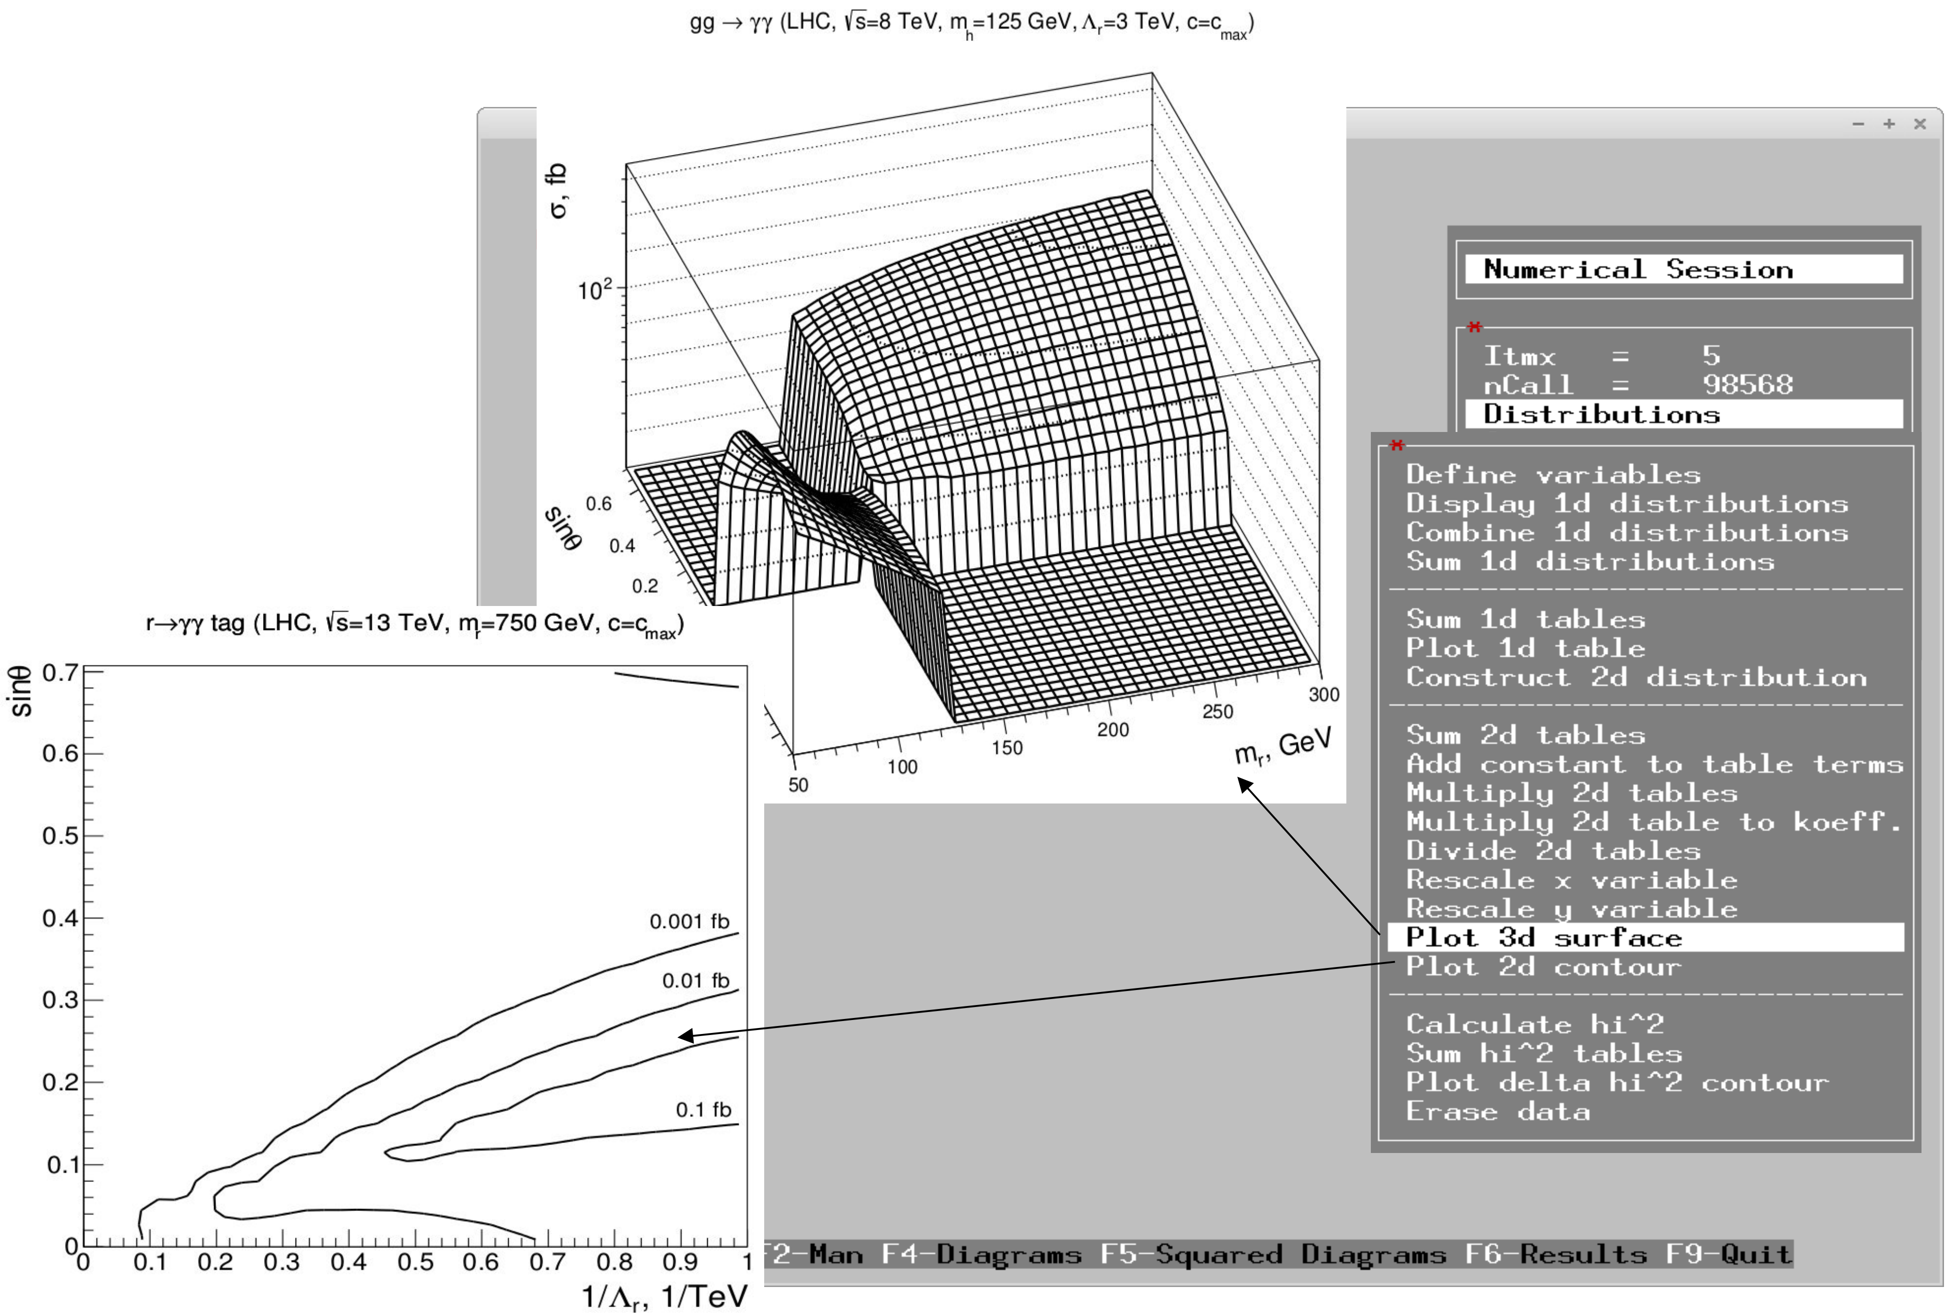


resulting tables can be used as external functions in the Constraints Model Table

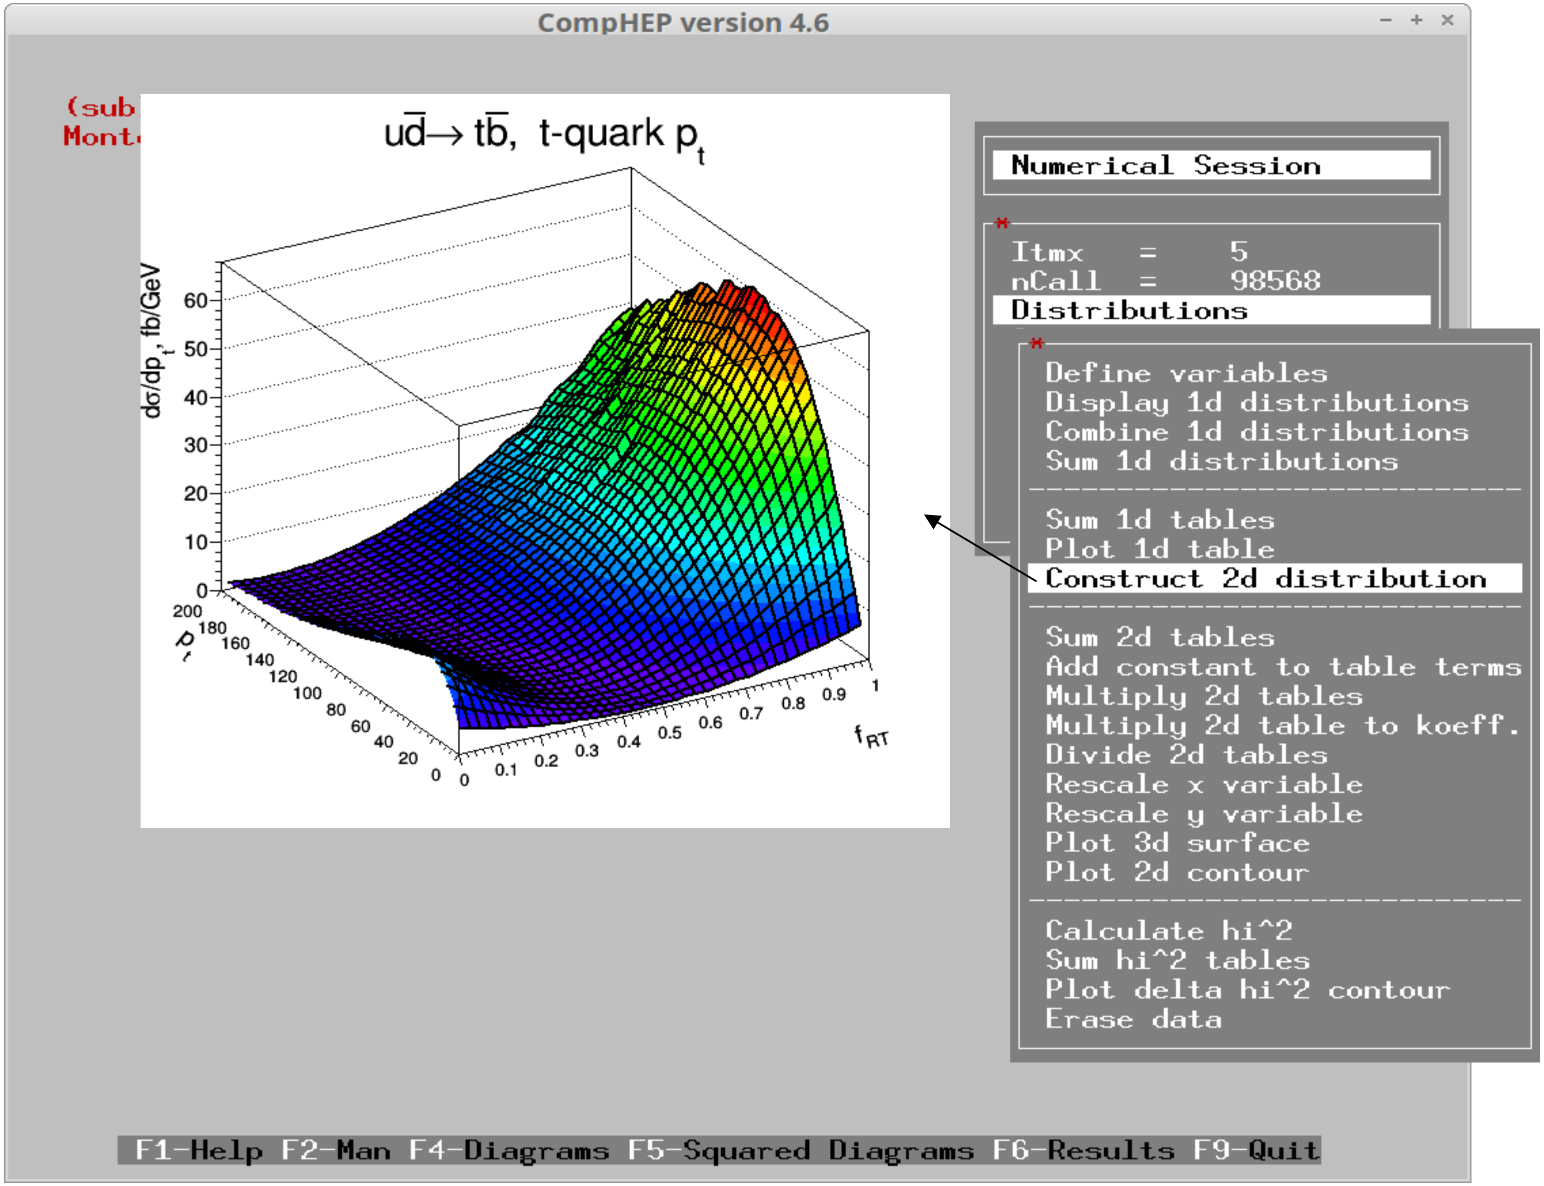




ROOT code generation to draw table functions (3D surfaces or 2D contours)



ROOT code generation for 3D phase space distributions dependent on a BSM model parameter



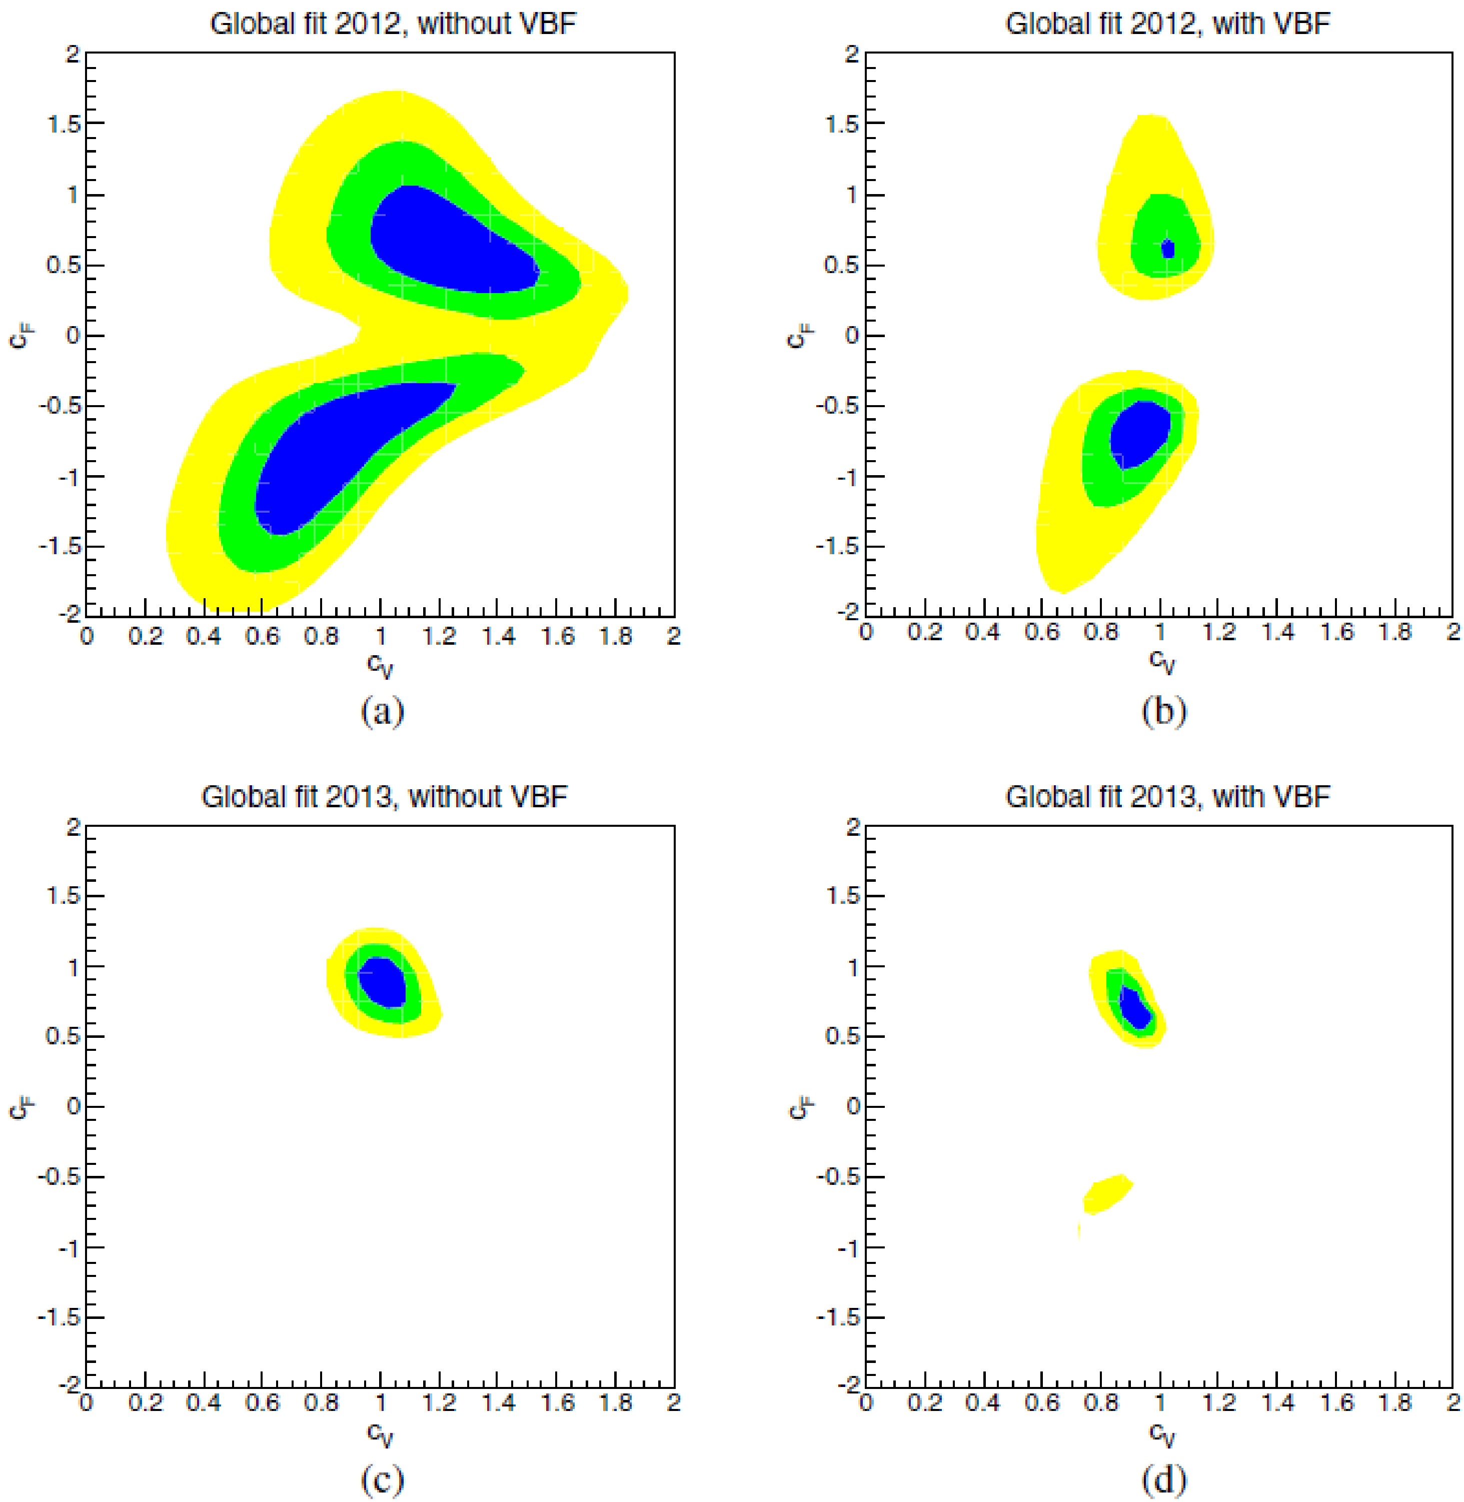
LHC

2014

ATLAS

+CMS

combined



Technical problems of evaluations with higher dim operators of BSM

- several anomalous couplings (AC) from different effective operators contribute to $|M|^2$
- different AC contribute to the decay widths of unstable particles
- from other side, contributions of individual AC are used for event samples in experimental searches

Separation of congenerous contributions (e.g. $1/\Lambda^2$ leading terms) in the event samples is of interest

Subsidiary bosons for BSM evaluations

New Physics (NP) contributions to the SM vertex

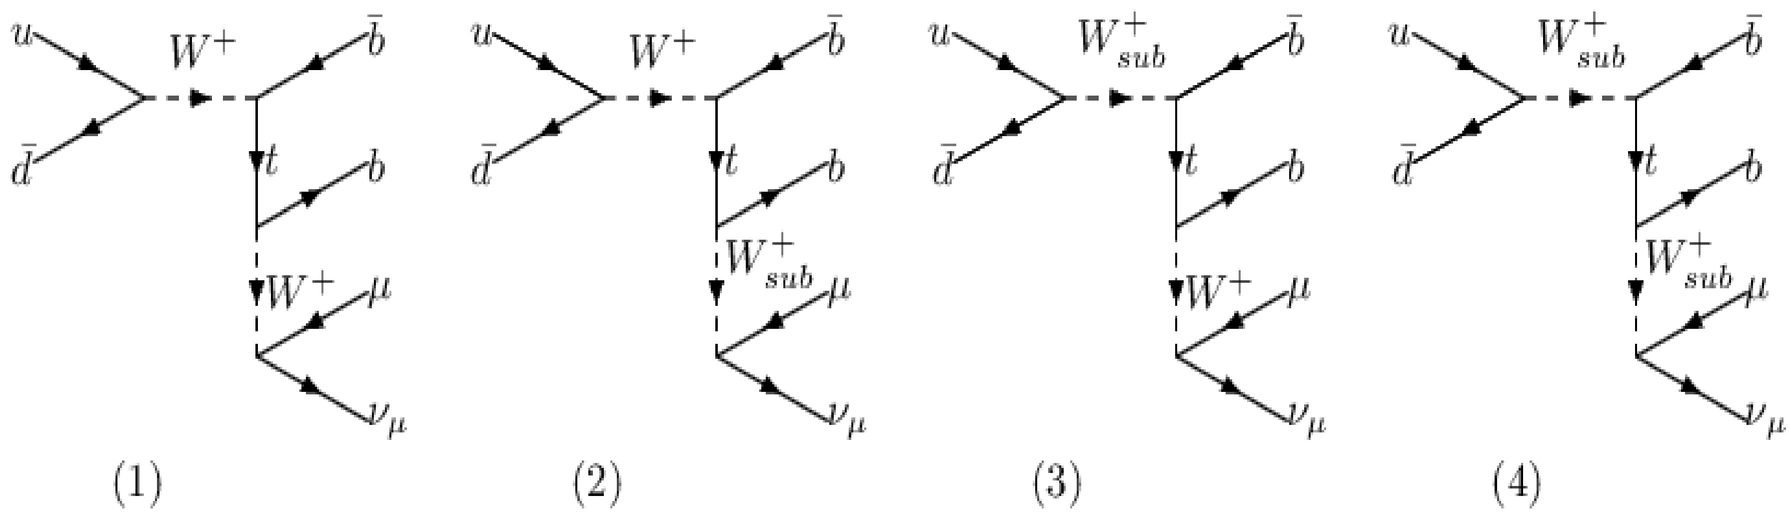
$$\Gamma_\mu = \Gamma_\mu^{\mathbf{SM}} + \Gamma_\mu^{\mathbf{NP_1}} + \Gamma_\mu^{\mathbf{NP_2}} + \ldots$$

Example: anomalous Wtb vertex

$$\mathbf{L_{Wtb}} = \frac{\mathbf{g}}{\sqrt{2}}\bar{\mathbf{b}}\gamma^\mu(\mathbf{f_V^L P_L} + \mathbf{f_V^R P_R})\mathbf{t}\,\mathbf{W}_\mu^- + \frac{\mathbf{g}}{\sqrt{2}}\bar{\mathbf{b}}\frac{\sigma^{\mu\nu}}{\mathbf{m_W}}(\mathbf{f_T^L P_L} + \mathbf{f_T^R P_R})\mathbf{t}\,\mathbf{W}_{\mu\nu}^- + h.c.$$

W boson SM	$\frac{\mathbf{g}}{2\sqrt{2}}\mathbf{f_V^L}\gamma^\mu(\mathbf{1} - \gamma_5)$
W boson subsidiary 1	$\frac{\mathbf{g}}{2\sqrt{2}}\mathbf{f_V^R}\gamma^\mu(\mathbf{1} + \gamma_5)$
W boson subsidiary 2	$\frac{\mathbf{g}}{2\mathbf{m_W}\sqrt{2}}\mathbf{f_T^L}\sigma^{\mu\nu}\mathbf{q}_\nu(\mathbf{1} + \gamma_5)$
W boson subsidiary 3	$\frac{\mathbf{g}}{2\mathbf{m_W}\sqrt{2}}\mathbf{f_T^R}\sigma^{\mu\nu}\mathbf{q}_\nu(\mathbf{1} - \gamma_5)$

Boos,Bunichev,Dudko,Perfilov, arXiv:1512.00826, arXiv:1607.00505



Diagrams (2),(3),(4) with subsidiary bosons for qq→bb $\mu\nu_\mu$

Squared amplitude with 'production' P_1,P_2 and 'decay' D_1,D_2

$$|\mathrm{M}|^2 \sim \frac{1}{\Gamma}[(\mathrm{f_V^L})^2\mathrm{P_1} + (\mathrm{f_V^R})^2\mathrm{P_2}] \times [(\mathrm{f_V^L})^2\mathrm{D_1} + (\mathrm{f_V^R})^2\mathrm{D_2}]$$

$$\sim \frac{1}{\Gamma}[(\mathrm{f_V^L})^4\mathrm{P_1D_1} + (\mathrm{f_V^L})^2(\mathrm{f_V^R})^2\mathrm{P_1D_2} + (\mathrm{f_V^L})^2(\mathrm{f_V^R})^2\mathrm{P_2D_1} + (\mathrm{f_V^R})^4\mathrm{P_2D_2}]$$

Three sets of event samples for simulation when fLV=fRV=1,fLT=fRT=0

$$(\mathrm{f_V^L f_V^R 00}) \Leftrightarrow (\mathrm{f_V^L})^4 \otimes (1000) \oplus (\mathrm{f_V^L})^2(\mathrm{f_V^R})^2 \otimes (1100)_{\mathrm{sub}} \oplus (\mathrm{f_V^R})^4 \otimes (0100)_{\mathrm{sub}}^{\mathrm{sub}}$$

Physics Analysis Summary CMS-PAS-TOP-14-007. Baesian Neural Network Discriminant (BNN)

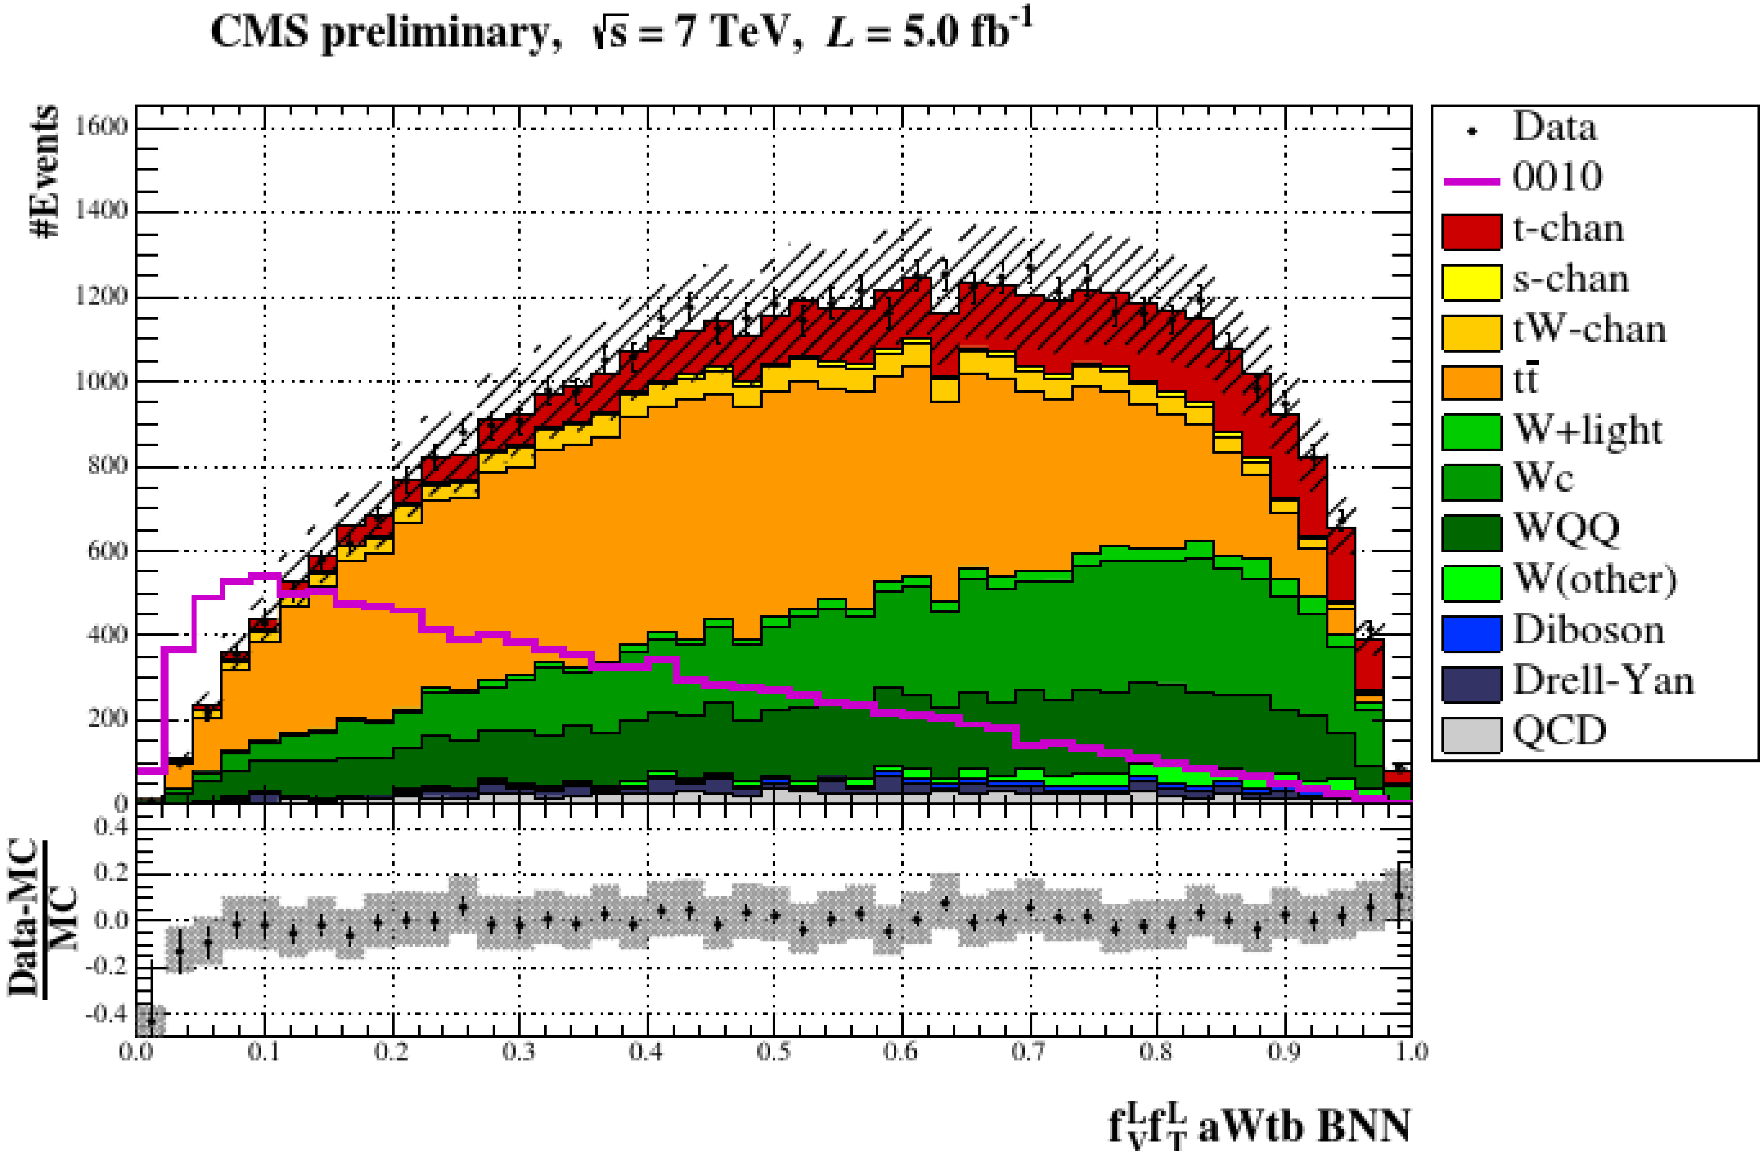


Figure 7: Data and model comparison of BNN aWtb discriminant for the (f_V^L, f_T^L) scenario. The BNN aWtb was trained to separate possible events with left tensor coupling in the Wtb interaction and SM events. The hashed band corresponds to the systematic uncertainty.

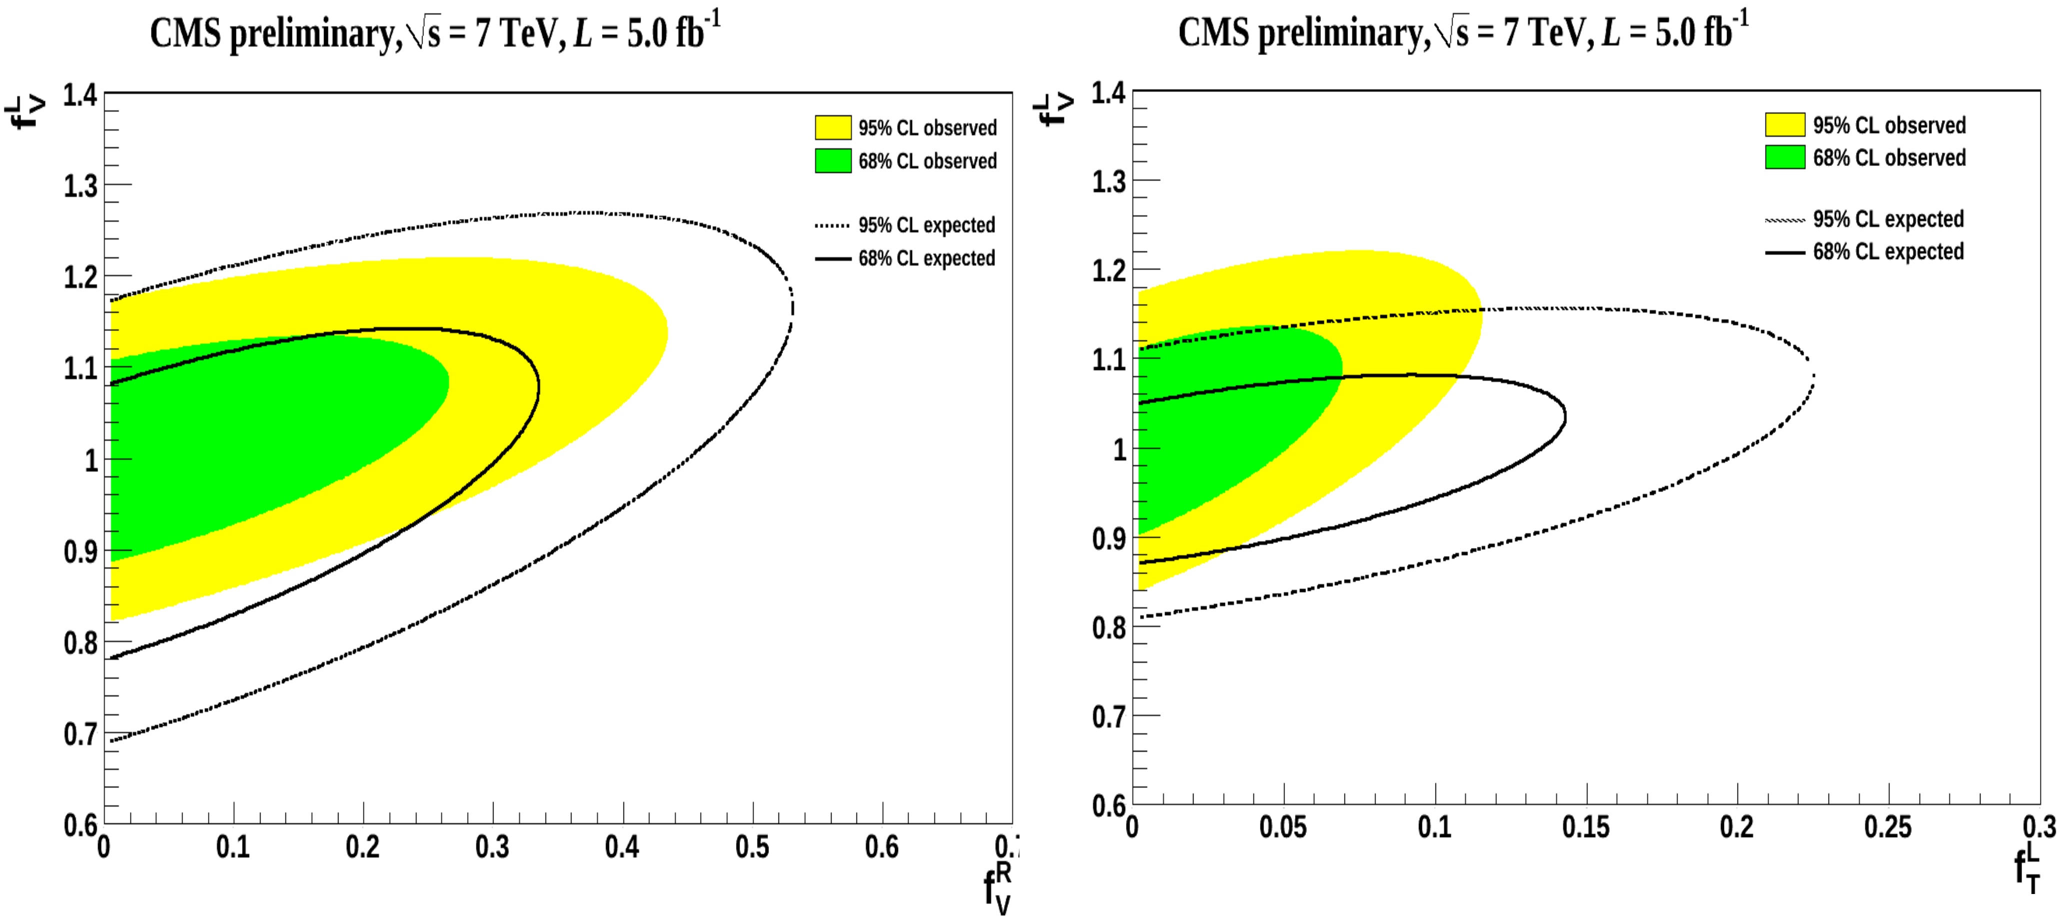
Physics Analysis Summary CMS-PAS-TOP-14-007



Important features improved

- **Batch system. Symbolical and numerical batch calculations in PBS/LSF**

- **Output event format respecting Les Houches agreements (LHEF with HepML header), convention LHAPDF, SUSY LHA format, BSM LHA format)**

- **Interfaces to PYTHIA/HERWIG and other**

- **Monte Carlo events data base (MCDB, see Comput. Phys.Commun.178(2008)222,hep-ph/0703287)**

- **Nuclear PDF's (Phys.Rev.C92(2015)044901, hep-ph/0703287)**

Summary

- CompHEP developments in 2010-2016 have been motivated mainly by experimental analyses of CMS and D0 collaborations. Tools for identification of the Higgs boson and the top quark have been developed.
- External functions, operations with cross section/Br tables, generation of combined fits and implementation of subsidiary fields are introduced to work in the BSM multiparameter space.
- Visualization, batch modes and interfaces significanltly improved.

Les Houches Agreements

There are many MC generators with their own advantages and application areas. Often we are forced to use several generators for reliable calculations:

Problems:

- Interfacing some MC codes (ME and SH generators): Les Houches Accord 1, Les Houches Event format
- Les Houches Accord 2: uniform interface to different PDF sets (LHAPDF package)
- Les Houches Accord 3: Interfacing SUSY codes to MC generators for parameters, spectrum, decays (SPA).
- BSM Les Houches Accord: fixing of parameter record for BSM
- Matching ME (LO/NLO) and SR(NL): CKKW, MC@NLO, Mrenna-Richardson, MLM, ...

Batch system in CompHEP

Both symbolic & numerical parts of the package have batch scripts: symb_batch.pl and num_batch.pl (in Perl)

Useful in the cases

- Computations of many (of the order of 100) subprocesses for LHC analyses
- **Remote calculations:** GUI not convenient
- **Support of parallel calculations**: very helpful for multi-CPU machines/computer clusters (pbs/lsf is available; grid in progress)

Symbolical batch: pp->m,Nm,b,B,H+ with t->b,H+ and T->m,Nm,B MSSM, tb=0.5, MH+=150GeV (H+->t*b->2f+bB dominates)

- Prepare process.dat following toy example: all points well documented

./symb_batch.pl -show diag (to exclude several sub-leading diagrams) 27 diagrams in 9 subprocesses (54 sqr. diag.) (15 G,G->m,Nm,b,B,H+ diagrams)

- ./symb_batch.pl -mp 2 calculate faster (2 times if you have 2*CPU machine)

```
#############################################################
#         Data file for symb_script.pl
#       For the symb_batch script version 1.0
#############################################################

#  You have to set the model number, which you are going to
#  The model number corresponds to the string number of the
#  in the CompHEP model menu in the GUI mode.
model number: 6

#  Beam names can be taken from a table of beams.
#  (see CompHEP in the GUI regime). Energy unit is GeV
beam 1: p
beam 2: p
beam energy 1: 7000.0
beam energy 2: 7000.0

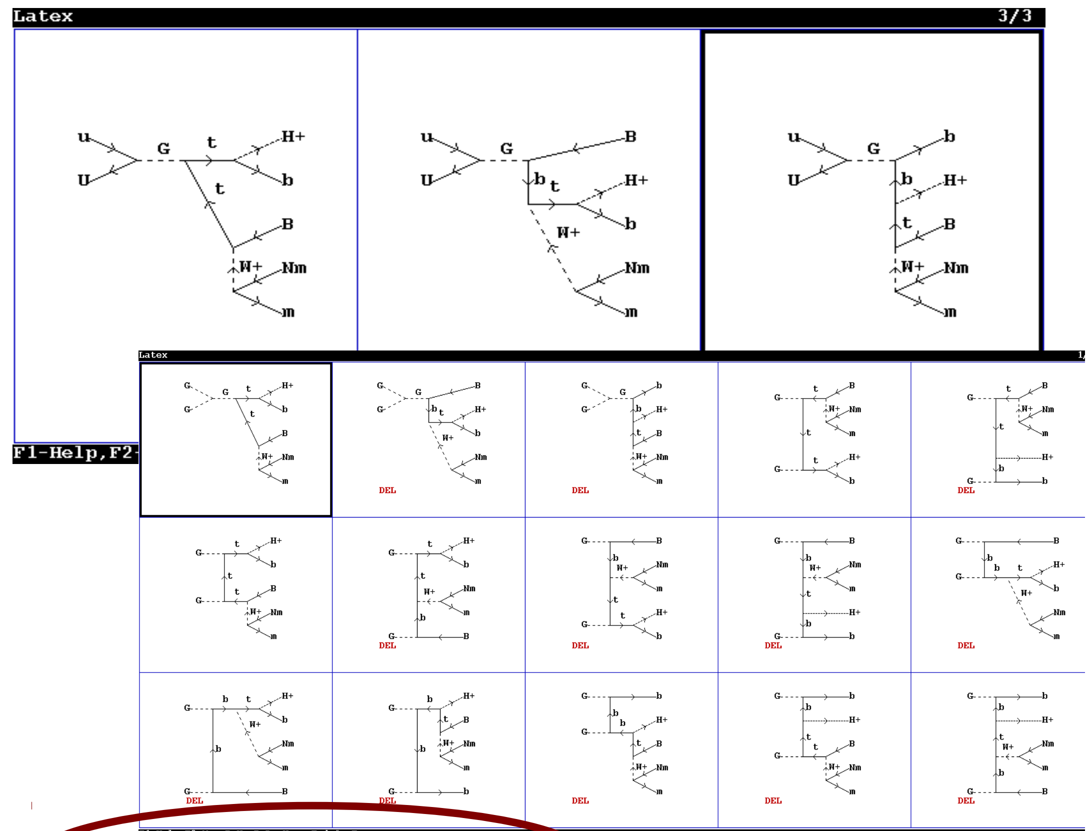
#  This string defines the final state of your process. Mode
#  particles and composite particles (see the corresponding
#  can be used.
final state: m,Nm,b,B,H+

#  If you'd like to exclude feynman diagrams with some model
#  particles (in propagators!), enter the particles here
exclude diagrams with: h,H,H3,u,d,c,s,A,Z

#  If you'd like to keep feynman diagrams with some model
#  particles (in propagators!), enter the particles here
#  Examples:
#keep diagrams with: t,b,Z,A
keep diagrams with:

#  If you enter no, s_comphep generates diagrams and does no
#  do symbolic calculations.
make symbolic calculations(yes/no): yes

#  If you enter no, comphep calculates all squared diagrams,
#  but n_comphep will not be created.
make n_comphep generator(yes/no): yes
```



```
[note]$ ./symb_batch.pl -show stat
Diagram statistics: total = 54, calculated = 44, deleted = 0
[note]$ Old n_comphep is deleted!
End of CompHEP symbolical session.
*** n_comphep creation details have been written to symb_batch.log
```

Numerical batch: pp->m,Nm,b,B,H+ in MSSM

- Prepare **batch.dat**: customize first process via GUI and execute **./num_batch.pl**
- Customize differences in other subprocesses (if needed) via GUI and execute **./num_batch.pl – add -proc ...** for the necessary subprocesses
- Start numerical calculations with **./num_batch.pl -run ...**

Sector by sector extension of the SM by dimension 5 and 6 effective operators

W.Buchmuller, D.Wyler, Nucl.Phys. B268 (1986) 621

Recent two-parametric global fits – nonlinear chiral realization of the SM gauge symmetry (alternative)
J.R. Espinosa, C. Grojean, M. Muhlleitner, M. Trott, JHEP 1205, 097 (2012) (arXiv:1202.3697 [hep-ph]), JHEP 1212, 045 (2012) (arXiv:1207.1717 [hep-ph])

- *scalar-gauge boson sector*

$$O_{\Phi G} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})G^a_{\mu\nu}G^{a\mu\nu} \qquad O_{\Phi G} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})G^a_{\mu\nu}\tilde{G}^{a\mu\nu}$$
$$O_{\Phi B} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})B_{\mu\nu}B^{\mu\nu} \qquad O_{\Phi B} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})B_{\mu\nu}\tilde{B}^{\mu\nu}$$
$$O_{\Phi W} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})W^i_{\mu\nu}W^{i\mu\nu} \qquad O_{\Phi W} = \frac{1}{2}(\Phi^\dagger\Phi - \frac{v^2}{2})W^i_{\mu\nu}\tilde{W}^{i\mu\nu}$$
$$O^{(1)}_{\Phi} = (\Phi^\dagger\Phi - \frac{v^2}{2})D_\mu\Phi^\dagger D^\mu\Phi$$

- *scalar-fermion sector*

$$O_{t\Phi} = (\Phi^\dagger\Phi - \frac{v^2}{2})(\bar{Q}_L\Phi^c t_R)$$
$$O_{b\Phi} = (\Phi^\dagger\Phi - \frac{v^2}{2})(\bar{Q}_L\Phi b_R)$$
$$O_{\tau\Phi} = (\Phi^\dagger\Phi - \frac{v^2}{2})(\bar{L}_L\Phi\tau_R)$$

$$\tilde{F}_{\mu\nu} = \epsilon_{\mu\nu\gamma\delta}F_{\gamma\delta}.$$

Effective triple vertices in the Buchmueller-Wyler basis (LanHEP calculation). Effective couplings C (Wilson coefficients) are multiplicative factors in front of O_{ij}
